## FICHE

Western Interstate Commission for Higher Education

The Western Interstate Commission for Higher Education and its 15 member states - Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington, and Wyoming - work collaboratively to expand educational access and excellence for all citizens of the West. By promoting innovation, cooperation, resource sharing, and sound public policy among states and institutions, WICHE strengthens higher education's contributions to the region's social, economic, and civic life. As the only organization in the West that focuses exclusively on higher education issues, from access and accountability to tuition and fees to online learning and innovation, WICHE strives to find answers to solve some of the most critical questions facing higher education today. WICHE's public policy research and collaborative programs support the West's citizens and its constantly evolving cultures. Visit www.wiche.edu for more information about our programs.

WICHE's Public Policy and Research unit conducts research and policy analysis on current and emerging issues in higher education and communicates this information and analysis to education and government policymakers. The Public Policy and Research unit maintains a database of historical enrollment and graduation data on which this report is based. Inquiries regarding these data should be directed to Brian Prescott, Senior Research Analyst, Public Policy and Research, (303) 541-0255 or bprescott@wiche.edu.

Hard copies of this report (2A365) are available from WICHE for $\$ 30.00$ each, plus shipping and handling. Purchasing information can be found on our website at www.wiche.edu/policy/ or by calling (303) 541-0248 or by writing to WICHE Publications Department, 3035 Center Green Drive, Suite 200, Boulder, CO 80301-2204. Readers may also download more detailed data tables for regions or individual states.

Education is widely recognized as being vital to our future - both as a nation and as individuals who want to participate fully in our society as wage earners and citizens. When it comes to education, the United States has a solid track record: it was the first country to establish public schooling for all and among the first to give the bulk of its population the opportunity to obtain a postsecondary education. These farsighted actions are two major reasons why our nation has ascended to the position of global leadership it enjoys today.

We earned that position through our efforts - but how long will we continue to enjoy it? Today, many other countries, recognizing the linkage between education and prosperity, have leapt forward with massive education programs in order to compete more effectively with us. In fact, it appears that the U.S. is falling behind some other developed countries in terms of the proportion of young people with either a high school education or postsecondary degrees or certificates. In a global economy that increasingly relies on knowledge and skill development, the prosperity of our nation is becoming ever more intertwined with the educational attainment level of our population.

Yet the challenge of ensuring a high-quality education for all Americans has never been more acute. Today, our nation is continuing to experience an upsurge in the number of school enrollments and high school graduates. This surge began in the early 1990 s and has strained capacity in many states. While the nation as a whole can expect some relief from these steady and substantial annual increases within the next several years, several states, like Arizona and Nevada, will continue to grapple with explosive growth. Others, such as North Dakota and Vermont, will experience shrinking enrollment and graduate numbers as their populations age or move away. Both extremes have enormous implications for our ability to provide our students with a high-quality education.

Perhaps more important, however, is the dramatic reshaping of our population. Immigration (legal and otherwise) and differences in birth rates among racial/ ethnic groups have contributed to demographic shifts that are radically transforming the face of public schools nationally and in many states. Today, White non-Hispanics
make up a shrinking proportion of enrollments and graduates, and this trend will continue. Meanwhile, the numbers of students from other groups - including some that have not been served well historically by our school systems or our colleges and universities (especially Hispanics) - are on the upswing.

Gaps in educational attainment based on race/ethnicity gaps that translate into huge differences in individual opportunity - have long existed, and eliminating these gaps has been the target of many public policy efforts. Such efforts generally have sought first and foremost to assure an equal playing field for all students, one in which hard work and ingenuity determine success. Certainly, providing for equal educational opportunity for all individuals is as vital as ever and the right thing to do morally. Today, however, we have a second, equally critical motivation to "do the right thing": our nation's future prosperity and security depend on it. The urgency of reducing educational attainment gaps is intensifying, due to the changing demographics of our student population. Failure to more fully address the educational needs of our rapidly growing minority populations threatens our nation's future.

This report helps to quantify the major changes in the size of our student population and its demographic makeup for the years ahead by projecting the number of high school graduates for each state and the nation. (In addition, we've posted individual state profiles on our website at www.wiche.edu/policy - follow the links to this publication's web page.) It is targeted at a wide range of users, including researchers, planners, policymakers, businesspeople, and education leaders. In providing these projections, we hope to stimulate more questions and research concerning how we can meet the challenges of educating our changing population.

David A. Longanecker

Western Interstate Commission for Higher Education Boulder, Colorado
February 2008

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

## ACKNOWLEDGMENTS

Brian Prescott, senior research analyst at WICHE, is primarily responsible for compiling and writing the 7th edition of Knocking at the College Door: Projections of High School Graduates by State and Race/Ethnicity. A number of other individuals have contributed substantially to preparing this publication as well. At WICHE, Jeanette Porter prepared data tables and figures; Candy Allen designed and produced the layout and graphics; and Annie Finnigan edited the text. The projections and accompanying analysis also benefited from careful review by and sage advice from Demarée Michelau and Dolores Mize.

Patrick Kelly of the National Center for Higher Education Management Systems lent his expertise with data analysis to solve several puzzles presented by the data. His online mapping tool (www.myonlinemaps.com) was also extremely helpful in producing maps for this publication and accompanying presentations. A host of others helped answer particular questions about the data. Though we can't name them all, we are very grateful for their assistance.

Finally, our thanks go to ACT and the College Board for their generous support for the production and dissemination of this publication.

## EXECUTIVE SUMMARY

This publication of Knocking at the College Door marks the $7^{\text {th }}$ edition of the Western Interstate Commission for Higher Education's projections of high school graduates. It updates forecasts of the number of high school graduates for public and nonpublic schools for the nation, four geographic regions, and all 50 states and the District of Columbia, and also includes projections of public school graduates by race/ethnicity. (In addition, we've posted individual state profiles on our website at www.wiche.edu/policy - follow the links to this publication's web page.) Projections for public school graduates cover the period 2005-06 through 2021-22 in this edition, while actual data are reported for preceding years back to 1991-92. The years of coverage for estimates and projections for nonpublic school graduates differ by state, although projections most commonly begin for that sector in 2002-03. Projections of school enrollments are also included, though they are not the central focus of the publication.

These projections provide a useful indicator of how the supply of high school graduates and the corresponding demand for postsecondary education are expected to change in the years to come. As such, these data have many uses, especially in planning and policymaking in an era when education - and increasingly, postsecondary education - are essential for the success of individuals and society as a whole. These projections offer a view into the future, indicating ways in which the current "system" of education may need to adapt to accommodate rapidly changing demographic conditions. There are two main sets of findings to be drawn from these projections.

## Changes in Total Production of High School Graduates

Predicted changes in total production of high school graduates for the nation and individual states account for the first set of findings. The overall demand for education is a central concern for policymakers and for planners at the state, school district, school, and postsecondary institutional levels. Demand helps determine how much space is needed to ensure each student has access to a quality education, both within the K-12 system and at colleges and universities. Projections indicate that the nation can expect that:

+ The rapid and sustained expansion in the number of high school graduates that began in the early 1990s will initially continue.
+ This expansion will reach a peak in 2007-08, when total graduates from public and nonpublic schools will exceed 3.34 million.
+ The production of high school graduates will slow moderately between 2008-09 and 2014-15.
+ After 2007-08 overall production of high school graduates will become much more stable for the foreseeable future than it was during the expansion period, when it was growing by leaps and bounds.

Since the responsibility for providing education largely falls on the states, demographic data at the state level are especially valuable. These projections show that states face very different demographic futures. In terms of total production of high school graduates, states may be categorized into six groups, based on the projected change in high school graduates between the last year for which actual data were available, 2004-05, and a decade later.

+ Dwindling production (losses of 10 percent or more): Kansas, Louisiana, ${ }^{1}$ Montana, New Hampshire, North Dakota, South Dakota, Vermont, and Wyoming (eight states).
+ Slowing production (losses of between 10 and 5 percent): Massachusetts, Michigan, Minnesota, Nebraska, New York, Ohio, Pennsylvania, Rhode Island, West Virginia, and Wisconsin (10 states).
+ Stable production (changes falling between a loss of 5 percent and an increase of 5 percent): Alaska, California, Connecticut, Hawaii, Illinois, Iowa, Kentucky, Maine, Maryland, Mississippi, Missouri, New Mexico, Oklahoma, Oregon, South Carolina, Tennessee, and Washington (17 states).
+ Manageable expansion (increases of between 5 and 10 percent): Alabama, Colorado, Delaware, District of Columbia, New Jersey, and Virginia (five states plus D.C.).
+ Rapid expansion (increases of between 10 and 20 percent): Arkansas, Idaho, Indiana, and North Carolina (four states).
+ Explosive growth (increases greater than 20 percent): Arizona, Florida, Georgia, Nevada, Texas, and Utah (six states).

These categories highlight how very different the futures of individual states look. They also show that the bulk of the growth is concentrated in the South and in the West, and especially in states in the lower latitudes of those regions. But this categorization scheme oversimplifies and obscures considerable variation in how individual states' production of high school graduates will change in the time between 2004-05 and 2014-15 and beyond. Individual states' projections are available in the tables in Appendix A.

## Escalating Diversification

The second key theme arising out of these projections relates to how the nation and most states are experiencing a shift in the racial/ethnic composition of their populations. In particular, the population of minority groups and especially Hispanics is increasing rapidly, while growth among White non-Hispanics is not projected to keep pace.

Among high school graduates, the story is much the same. The nation and more and more states are closing in on "majority-minority" status relative to public high school graduating classes, in which the number of graduates who are not White non-Hispanic exceeds the number of graduates who are. Between 2004-05 and 2014-15, WICHE projects that the nation's public high schools will produce:

+ Almost 207,000 more Hispanic graduates (an increase of 54 percent).
+ Nearly 46,000 more Asian/Pacific Islander graduates (an increase of 32 percent).
+ About 12,000 more Black non-Hispanic graduates (an increase of 3 percent).
+ About 2,000 more American Indian/Alaska Native graduates (an increase of 7 percent).
+ Nearly 197,000 fewer White non-Hispanic graduates (a decline of 11 percent).

These data show that minorities account for all the growth in the our public high schools' production of graduates. ${ }^{2}$ Especially noteworthy is that the projected increase in Hispanic graduates alone more than offsets the decrease in White non-Hispanic graduates. In fact, if minority students completed high school at the same rate that White non-Hispanic students do, this shift would be even more dramatic.

Clearly, the composition of our schools is changing. State policymakers and officials in school districts, K-12 schools, and postsecondary institutions need to be aware of these changes and how they might impact curriculum and preparation, the demand for support services, the demand for postsecondary education, affordability, and other issues.

The national trends are playing out in many states as well. The number of Hispanic graduates from public schools is expected to rise in all states except Hawaii by 2014-15, with the largest increases in the southern parts of the West and the South. In percentage terms, however, states all over the country will need to educate substantially more Hispanic students - and will be producing more Hispanic graduates - than they did previously. And Hispanics are not the only group that can expect to
grow: the number of Asian/Pacific Islander graduates will climb in virtually all states, with rapid growth rates seen in many of them. Conversely, by 2014-15 only six states will graduate more White non-Hispanic students than they did in 2004-05, while the majority of states outside the South can expect average annual declines in their production of White non-Hispanic graduates. Appendix A contains detailed tables for each state, including actual and projected data for graduates by race/ethnicity.

## How These Data Might Be Used

Demographic data such as these projections are vital to crafting effective policy solutions to the challenge of providing high-quality educational opportunities to all students. One of the most important implications that arises from these projections is that the stark differences in individual states' overall production of high school graduates present entirely different challenges to educational planners and policymakers and necessitate carefully tailored policy approaches. In other words, states, school districts, schools, and postsecondary institutions should carefully examine demographic data and projections such as these before adopting any policy solution (especially a policy enacted by one of its counterparts), to ensure that it fits its own needs and conditions.

Beyond that, these data have many potential uses for a variety of audiences. A few examples of how they might be effectively employed follow.

+ State policymakers may use the projections to adjust accountability schemes, to give schools, school districts, and postsecondary institutions incentives to reach out to and serve traditionally underrepresented student populations more effectively. In states anticipating a large expansion of high school graduates, for example, policymakers may use the projections to estimate the scope of the capacity challenge ahead of them and to craft solutions that leverage proven technology to deliver education more efficiently. Policymakers in states expecting a downturn may rely on the projections to implement changes in the nonresident tuition rate for their postsecondary institutions, as one way to appeal to neighboring states with a surplus of graduates; or they may use them as a rationale for committing more resources to programs, like WICHE's Western Undergraduate Exchange (http://wue.wiche.edu), that help facilitate student mobility across state lines.
+ Given the rapid increase in the number of traditionally underrepresented students, combined with projected stagnation in the supply of high school graduates, college presidents may respond by adjusting the ways in which they reach out to

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

minority students and adults. Such adjustments may influence the curricula, as well as the times when and the locations where courses are taught; or they may affect institutional tuition and financial aid policies.

+ Researchers can employ the data to forecast additional data points of use to public policymakers. They may also make the data a central element of an argument for increased attention to issues of postsecondary access, success, and equity.

These projections indicate that our nation's schools have big but varied challenges ahead of them. Those challenges are about assuring adequate capacity, preserving or enhancing educational quality, and responding to rapidly changing student bodies. The 50 states' educational policies will have a crucial effect on how well schools are able to respond to those challenges. Our ability to meet these challenges will go a long way in determining whether all individuals have an equal opportunity to obtain a good education, get a decent job, and be productive contributors to our society and economy. It will also play a pivotal role in whether our states and our nation can remain competitive in a global, knowledge-based economy that is dependent upon our improving the educational attainment levels of all citizens, including those minority populations that are clearly growing the fastest in our society.

## Endnotes

${ }^{1}$ Louisiana's projections were substantially influenced by the aftermath of Hurricane Katrina. More information and analysis on how the state's projections were affected is available in Chapter 4.
${ }^{2}$ A complete picture of the racial/ethnic composition of the high school graduate cohort is not possible because data on race/ethnicity are insufficient for nonpublic schools and homeschools, although public schools account for a large majority of enrollments nationally.

## Chapter 1. INTRODUCTION

For some time now, the link between education and individual and societal prosperity has been well established. One indicator of this linkage is the earnings gap between those who have a college degree or credential and those who do not, a gap that continues to widen. Furthermore, high-wage employment prospects increasingly are coalescing around local communities and in states that can provide employers with a labor force full of highly educated, high-skill workers. The rise of global markets appears to be reinforcing the need for Americans to obtain more years of education and educational credentials. But even as education becomes ever more essential to a prosperous society and a middleclass lifestyle, our communities, states, and nation face growing challenges in providing it.

As education becomes ever more critical to success, educational planners and policymakers face growing pressure to ensure that all individuals have a reasonable chance to obtain the skills and abilities that are needed in a globally competitive economy. Today, and in the foreseeable future, they will need to provide educational opportunities to a population that is changing rapidly in size and racial/ethnic composition. The U.S. Census Bureau announced not long ago that our nations' population now exceeds 300 million and continues to grow rapidly. ${ }^{1}$ Not only is our country swelling in size, it is simultaneously growing more and more racially and ethnically diverse. These demographic changes, and the economic challenges that accompany them, have tremendous implications for education policies. Will the nation be able to expand educational capacity to meet the needs of the growing population of school-aged children? How might educational delivery and curricula need to change in order to accommodate both growth and the particular demands of the more rapidly growing populations that have been poorly served historically? How can these challenges be met affordably and without compromising quality?

All these questions are critical for our nation - and the responsibility for providing answers falls more heavily on individual states, as well as on schools and school districts. And as the projections in this publication will show, each region and state will face its own distinct set of demographic realities and educational and economic hurdles. Some states, like Arizona and Nevada, will be challenged to find ways to effectively serve a swiftly diversifying, explosively growing school-age population, while other states face the opposite problem: a shrinking population that may make it difficult to sustain existing educational infrastructure. These very different challenges
will require very different solutions that begin with a complete understanding of the demography distinct to each state.

The projections developed by the Western Interstate Commission for Higher Education (WICHE) for this publication focus on the traditional education pipeline from birth to enrollment in first grade at about age six to on-time high school graduation - because for the most part they rely on factors that are relatively well known and well (but not perfectly, of course) measured. And although adult education is not a focus of this research, labor force experts are predicting that individuals' working lives are becoming less linear, so educational planners and policymakers will also need to gauge how demand will change among adults seeking further training and education. ${ }^{2}$

This publication represents the $7^{\text {th }}$ edition of WICHE's projections of high school graduates. WICHE's projections have an established track record and are widely respected across the nation. Among our users are national, state, and local policymakers including legislators, legislative staff, and governor's offices; state education coordinating and governing agencies; schools and school districts; public and private postsecondary institutions; researchers; and the media. The projections have undergone several changes in their over-30-year-long history. Among the most notable enhancements were the disaggregation of projections by race/ethnicity and the development of income-based projections, which were included for the first time in the previous edition, published in 2003.

This edition contains historical data as well as projections for each of the 50 states and the District of Columbia, with separate national and regional projections. Historical data on public high school graduates reach back to 1991-92 and extend through 2004-05, and projections extend up to 2021-22. The last year for which births data were available established the last year of the projections, since WICHE does not make forecasts for births. The projections are available for total graduates of nonpublic schools and public schools, as well as for graduates of public schools by five racial/ethnic categories: American Indian/Alaska Native; Asian/Pacific Islander; Black nonHispanic; Hispanic; and White non-Hispanic.

Consistent with past editions of this publication, these projections are produced using the cohort survival ratio (CSR) methodology. CSR is an approach that has seen wide use in enrollment forecasting at multiple levels, from schools and school districts to national projections.

Its appeal is based on two main features: it does not require an elaborate statistical modeling approach, which makes it a methodology that is relatively transparent to policymakers; and the data required to apply it are not overly extensive and are generally available. CSR contains important assumptions about the ways in which students progress through school, especially concerning retention and migration patterns. These assumptions mean that CSR produces projections that generally reflect historical patterns and trends. They also suggest that readers should exercise caution when using the projections, especially for years further out from the last year of actual data. The longer-term projections serve best when used as broad indicators of the size and composition of graduating classes, rather than as precise predictions of the graduating class size in a specific year. Accuracy checks on prior editions' projections have generally demonstrated that WICHE's projections for public school graduates have fallen within a 5 percent variance of the actual data obtained later. Not surprisingly, projections have been more accurate in states where the population is larger and more stable. Details about WICHE's accuracy in projecting high school graduates in past editions can be obtained by contacting us.

This edition heralds new enhancements in WICHE's projections, some realized here and others planned for the future. First and foremost, in an effort to make the projections more relevant and timely, they now rely on data from the Common Core of Data (CCD), which supplies the federal government's official statistics on public education. In past editions, WICHE collected public school enrollments and graduates data from the states individually. Although in most states, this change in data sources had little noticeable effect on the projections or on the series of historical graduates data, comparisons to the data in past editions of this publication should be made with care. However, the change to the CCD will have numerous benefits, including the ability to produce updated projections more frequently than every five years, as we have done in the past. Additionally, the switch will allow WICHE to perform more detailed analyses of the data for states, as well as for other geographic areas. More details on the adoption of the CCD data can be found in Chapter 4 and in Appendix B.

Unfortunately, this edition does not include projections by income, due to a lack of new data sufficient for the task of updating the analysis from the preceding edition. However, income is an increasingly important dimension of demography and demographic change, and concerns about the adequacy of educational funding and especially access and affordability in postsecondary institutions are not going away. WICHE plans to reexamine how the income projections might be updated in the future, using
data from the American Community Survey, which the U.S. Census Bureau is currently rolling out to replace the decennial census's long form with data available annually. More information concerning the decision not to update the projections by income for this publication is available in Chapter 4.

In the two chapters that follow, this report documents, first, the overall change in the number of high school graduates that the nation, each of its four geographic regions, and individual states may expect to see in the coming years. These data include graduates from public schools as well as estimated figures for graduates from nonpublic schools. The next chapter examines more closely the racial/ethnic composition of public high school graduating classes. Though there are important differences by state, the central finding in this chapter is the rapid diversification of virtually all states' high school graduate cohorts, which is largely the result of a dramatic upsurge in Hispanic students combined with a decrease in the number of White non-Hispanic students. Next comes a more detailed description of the methodology used in this study. Finally, an appendix provides state-bystate views of the number of high school graduates from public and nonpublic schools, as well as the composition of public school graduates by race/ethnicity.

## Endnotes

## Chapter 2. PROJECTIONS OF HIGH SCHOOL GRADUATES

Not long ago, the U.S. Census Bureau reported that the national population exceeded 300 million. ${ }^{1}$ While longer life spans are one major reason population numbers are at a record high, another is the pace of births: the Census Bureau estimates that a baby is born in the U.S. about every 15 seconds. It is vital that our nation and its states be prepared for the future demands placed on our schools by these children.

Although the nation continues in a long-term population growth pattern, previous projections have indicated that the size of the nation's high school graduating classes will reach a crest in 2007-08, a pattern that was expected for most of the states as well. ${ }^{2}$ Updated data used for these projections mostly bear that forecast out. However, the data also show that while the nation's supply of high school graduates is projected to fall slightly in subsequent years, it will rise again and exceed the 2007-08 level by 2021-22.

But the national picture is only a part of the story. In particular, it masks the fact that much of the growth in population and in school enrollments is occurring in the South and the West at the expense of the Midwest and, especially, the Northeast. In fact, the dip in high school graduates that is projected to follow 2007-08 will be barely noticeable in many parts of the South and West, while the other two regions will experience substantial declines that last through the better part of the next decade. Some states in the two faster-growing regions, especially Arizona, Nevada, and Texas, will see large annual increases in enrollments and high school graduates virtually every year of the projection period.

Clearly, the wide variation in the demand facing individual states will require very different policies in order to ensure both adequate capacity and high quality. Many states will also confront a rapidly diversifying school-age population, which will only add to the challenge. (Projected changes in enrollments and high school graduates by race/ ethnicity are the subject of Chapter 3.)

This chapter describes in broad strokes the changes in the number of school enrollments and the number of graduates for the nation and for each of four geographic regions. Each section also addresses how the number of births will influence future projections. Finally, the regional analyses also include information about projected changes in high school graduating classes in individual states, plus the degree to which each state's projected changes will contribute to regional changes. (For detailed individual state tables, see Appendix A.)

## National Trends

The U.S. is on the cusp of seeing the first overall decline in the number of high school graduates produced nationally in more than a decade. State education agencies and postsecondary institutions used to planning for ever-larger demand emanating from students progressing along the traditional educational pipeline will need to adjust to a contraction in the national supply of high school graduates as it begins to gradually decline after 2008.

In particular, postsecondary institutions accustomed to filling entering classes with relative ease will likely face greater competition for fewer traditional-age students. Those who have not already turned greater attention to nontraditional enrollments may be compelled to do so - a positive development if, as expected, the jobs of the future will demand more education and skills mastery. Meanwhile, many schools and school districts have already been seeing reduced rates of growth in the earlier grade levels, but they will also need to be prepared for renewed growth that will begin picking up, as the number of births has increased in recent years.

But since most of the changes in educational demand will be not be nationwide, national trends are less important than regional, state, and local ones. So while the picture painted by national trends will parallel more proximate changes in some states and localities, others will face conditions very unlike those seen in the national picture. In particular, states in the Northeast will generally see a severe contraction in demand, while the most populated states in the South and West will barely notice any changes in trends that have already strained capacity in schools and colleges for many years.

## Elementary and Secondary Enrollments

While this publication has always concentrated on high school graduates (a sensible focus, given that WICHE's mission is specifically directed to issues involving postsecondary education), it is apparent that many users, particularly schools, school districts, and statewide K-12 education agencies, also make use of these projections for analytical and planning purposes. Moreover, tomorrow's high school graduates are today enrolled somewhere in grades one to 12 . For these reasons, this publication also includes coverage of first through $12^{\text {th }}$ grade enrollment trends and projections.

Nationally, public school enrollments increased steadily between the turn of the century and 2005-06, the last year for which enrollments data were available. K-12

## Knocking at the College Door

enrollments grew by 3.8 percent over that time frame (Table 2.1), with total enrollments reaching just over 44.1 million by 2005-06. That year, there were nearly 14.8 million students in public high schools (grades nine to 12 ), reflecting an increase of almost 11 percent over 2000-01. The large difference in these growth rates is partially explained by the declining number of births throughout most of the 1990s: births fell by 6.7 percent between the peak year of 1990 and 1997 before climbing again (Figure 2.1). This drop came on the heels of the 1980s, a decade characterized by rapid growth in the number of births, and most of the high school students in 2005-06 were born during these peak years.

Immigrants from outside the nation also likely account for a portion of the difference in enrollment growth rates. This is simply due to the fact that, since high school students are older than elementary students, there are more years during which an individual can enter the country in time to be counted as being enrolled in high
school. Furthermore, immigration is more likely to take place among older children and adolescents than it is among younger children. ${ }^{3}$ In addition, immigration numbers overall have been rising: the U.S. Census Bureau estimates that all 50 states and the District of Columbia experienced a net increase in international migration between 2000 and 2006. ${ }^{4}$

Adding in estimates of nonpublic school enrollments brings total enrollments in all grades nationally in 2005-06 up to 48.7 million, with 16.1 million in the high school grades alone. ${ }^{5}$ Nonpublic enrollments that year accounted for an estimated 9.4 percent of total enrollments and 8.2 percent of high school enrollments. Those shares were slightly lower than in preceding years. While sampling error may play a part in this decline, it is possible that the recession of the early $21^{\text {st }}$ century contributed to families finding it more difficult to afford an expensive private education.

$\square$ Actual Figures Projected Figures

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

Table 2.1 also shows enrollment projections. Since all projections begin with actual birth data, it is possible to project high school enrollments out further into the future than it is for total enrollments. Projections indicate that enrollments in all grades nationwide will not change substantially in the short term. In the public sector,

Figure 2.1. Births in the U.S., 1981-2004

Source: National Center for Health Statistics, Centers for Disease Control and Prevention.

Figure 2.2. U.S. Public High School Graduates 1994-95 to 2004-05 (Actual), 2005-06 to 2021-22 (Projected)

enrollments are projected to climb by less than 1 percent between 2005-06 and 2010-11. Nonpublic schools' total enrollments are projected to decline slightly. Projected enrollments in the nation's public high schools show a similar, relatively stable pattern out to 2018-19, with a difference of less than 624,000 students between the highest and the lowest projected years. Despite these modest changes, patterns in both series of projections are apparent. Whereas enrollments in all grades are expected to gradually climb throughout the years for which projections were made, high school enrollments will first dip somewhat, bottoming out in 2011-12 before rising again through the remaining projected years.

High School Graduates Nationally, the number of public high school graduates in 2004-05 stood at just under 2.8 million, with nonpublic schools adding an estimated 300,000 graduates (Table 2.2). Up to that point, the nation had seen a steadily climbing number of graduates from both public and private high schools. Over the period between 1994-95 and 2004-05, the number of public high school graduates rose by 23.1 percent (Figure 2.2). This rapid growth was associated primarily with the "baby boom echo" generation as it made its way through high school and beyond.

Projections indicate that the number of public high school graduates is expected to continue to rise through 2007-08, when it will peak at just over 3 million. The first

| Actual Figures |  |  | Projected Figur |

three years of projected increases (2005-06 through 2007-08) represent the tail end of a period of sustained growth lasting more than a decade. In the peak year of 2007-08, the nation's public high school graduating class will be larger than 2004-05 by roughly 235,000 . From there, the number of public high school graduates will undergo a mostly steady, gradual decline lasting through 2013-14, after which the number of graduates will slowly recover to its previous peak level by 2017-18. The forecasted decline between 2008 and 2014 will ultimately yield a graduating class that is smaller by about 118,000 students. Overall, the average annual rates of change for these three distinct periods are: 2.7 percent growth between 2004-05 and 2007-08; almost 0.7 percent decline between 2007-08 and 2013-14; and 1.2 percent growth between 2013-14 and 2017-18.

The number of graduates from nonpublic schools nationally shows somewhat more year-to-year variance (Figure 2.3). Data indicate that the number of nonpublic school graduates peaked in 2002-03, with the next several years showing virtually no change. According to projections, 2007-08 will set the high-water mark for nonpublic graduates, at more than 306,000. Thereafter, projections indicate a substantial decline that will last all the way through 2014-15 before showing any signs of recovery. In the intervening seven years, the number of nonpublic graduates nationally will fall by over 43,000 or 14 percent.

In the first peak year for nonpublic school graduates, 2002-03, the available data indicate that nonpublic schools accounted for approximately 9.9 percent of all high school graduates. But from that point forward, the projections show that the share of high school graduates in the United States coming out of nonpublic schools will not be as high. By 2014-15, the share is forecast to have dropped to 8.3 percent. Even in the 2007-08 peak year, nonpublic schools will account for only about 9.2 percent of all high school graduates nationwide, less than the share of graduates nonpublic schools produced just a few years earlier.

Combining the projections of graduates from both public and nonpublic schools gives a more complete picture of the changes in demand from traditionalage college students that our nation's postsecondary education and training providers will face. Figure 2.4 illustrates how the total number of graduates is expected to change in the coming years. Because public schools supply the vast majority of graduates, this figure looks very similar to the one for public school graduates alone. It indicates that high school

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

graduates will top out first for the class of 2008 at over 3.3 million. That year, the nation will graduate nearly 244,000 more high school students than it did in 2004-05, an increase of 7.9 percent. Thereafter, the number of high school graduates nationally is expected to stabilize, relative to the sustained climb in total graduates
over the 13 years leading up to this peak. The number of graduates will fall slightly between 2007-08 and 2013-14 by about 150,000 , or 4.5 percent, before resuming a growth pattern until 2017-18. Extending historical trends, the nation's high school graduates will near 3.4 million by the beginning of the third decade of the $21^{\text {st }}$ century.

Of course, the demand for postsecondary enrollments among traditional-age students is only driven in part by the number of graduates emerging from the nation's high schools. The proclivity of those graduates to seek entry into a postsecondary institution is also a key determinant of demand. The collegegoing rate of recent high school graduates has not been constant over time. Figure 2.5 shows how that indicator of demand changed between 1992 and 2004, when it ranged between 54 and 59 percent. (WICHE provides this additional information merely to help readers evaluate the possible impact of future demand; projected future collegegoing rates were not calculated.)

[^0] graduates were for 2004-05.

As with any national perspective on demographic change, this one obscures considerable shifting that is happening regionally and in individual states. The next section addresses differences in the projected supply of high school graduates based on the four major regional divisions of the country and the states within them.

## Regional and State Trends

The four regions of the country (shown in Figure 2.6, as we define them for

## Knocking at the College Door

this publication) face very different demographic futures. Readers of the preceding edition of Knocking at the College Door will note that the makeup of these regions has changed. The first reason to adjust the regions was to move Maryland, Delaware, and the District of Columbia from the Northeast to the South, which is consistent with
the regional geographic divisions established by the U.S. Census Bureau. The second change was to include North Dakota and South Dakota in the Western region, since they face many of the same conditions as neighboring Western states, such as Montana and Wyoming, and also share a number of attributes with them. In addition, both

Figure 2.5. College-Going Rate of Recent U.S. High School Graduates 1992-2004

Source: National Center for Higher Education Management Systems (NCHEMS), www.higheredinfo.org.

are WICHE members.

Figure 2.7 shows changes in the number of graduates from both public and nonpublic high schools for all four regions. It indicates that by the end of the projected time period, the Northeast can expect to graduate a substantially reduced number of students. The Midwest will also produce fewer graduates, but both the South and the West will contend with growth.

The Northeast will see a general decline over virtually the entire period between its peak year of 2007-08 and the end of the projections in 2021-22, amounting to a drop equal to about 1 percent per year on average. In the Midwest, graduates will continue to increase until 2007-08 before beginning a long decline that will ultimately see the region's number of graduates fall by over 60,000 , or about 8 percent, by 2014-15. Thereafter, the number of graduates is projected to fluctuate. In 2004-05, the number of high school graduates in the West surpassed the Midwest for the first time, and indications are that the gap will continue to widen throughout the projection period. The number of graduates in the West is forecast to peak in 2008-09 at just over 803,000 before beginning a period of slow

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

decline until 2014-15, shedding about 2 percent of its graduates during this period. Thereafter, the number of graduates in the West will begin climbing again.

Overall, the trend in the South is generally and rapidly upward. Between 2004-05 and 2021-22, the South will add nearly 210,000 more high school graduates, nearly a 20 percent increase. Most of the projected increase is forecast for the periods 2004-05 to 2007-08 and 2014-15 to 2017-18, with the intervening years

Figure 2.7. Public and Nonpublic High School Graduates by Region 1996-97 to 2004-05 (Estimated), 2005-06 to 2021-22 (Projected)

Figure 2.8. Contribution to the Nation's Change in Total High School Graduates (Relative to 2004-05) by Region

characterized by uneven year-to-year changes.

Figure 2.8 provides a view of projected national change in the number of total high school graduates for three different time frames (short, medium, and long term), with the total change disaggregated by region. That is, the figure illustrates how changes in the projections of total high school graduates for each of the regions contribute to the projected national change. As indicated by the left column, in 2009-10 all four regions are expected to grow, but the South and the West will contribute the bulk of the additional graduates projected for the nation. By 2014-15, the Midwest and Northeast will produce fewer graduates than they did in 2004-05. But the additional output from the South and West will more than compensate for the declining regions, so the nation's high school graduates numbers will be higher than in 2004-05. A similar story is evident for the 2019-20 projections, when the increase from the South and West is even more pronounced.

Much as the regional picture reveals more detail than what is apparent from the national perspective, so too can conditions in individual states vary from the regional pattern, sometimes dramatically. The

## Knocking at the College Door

following sections address each of the regions in greater detail.

## West

In many ways, the West might be called the least homogenous of all nation's geographic regions. Western states are characterized by diverse economies, ranging from those in Alaska and Wyoming, which are heavily dependent on natural resource extraction industries, to those in Colorado and California, which are more in step with globalized high technology industries, to those like Hawaii, which are dominated by tourism and a U.S. military presence.

Demographically, there is also great variety. The West includes states with very little racial and ethnic diversity and a stable or declining population, as well as states that can already be characterized as majority-minority (when the population of those who are not White non-Hispanics outnumbers the population of those who are) and others that are seeing their populations explode, both in terms of total numbers and diversity. Home to the most populous state in the nation, as well as to some of the most sparsely populated states, the West will occasionally appear to mirror conditions prevalent in California in analyses of demographic trends. It is important to be sensitive to how trends in California affect regional patterns, as well as to point out differences faced by its neighbors.

The U.S. Census Bureau projects that the West will be the country's fastest-growing region between 2000 and 2020 in terms of total population. ${ }^{6}$ Domestic migration and natural increase (the extent to which births exceed deaths) are two principal components of this conclusion. According to the last decennial census, the West was able to attract about as many individuals from other regions as it lost to those regions. Between 1995 and 2000, the West's domestic migration rate was 0.2 people per 1,000 population. ${ }^{7}$ Estimates of domestic migration between 2000 and 2004 indicate that the West's rate of importing new residents from elsewhere within the country increased to 3.2 per $1,000 .{ }^{8}$ Births are a second major contributor to the overall population change. Figure 2.9 shows how births in the West underwent rapid and sustained growth between 1981 and 1990, during which time births increased by over 30 percent. Thereafter, births declined modestly through 1997, and then rose in fits and starts until 2003, when they nearly reached their previous peak.

## Elementary and Secondary Enrollments

Table 2.3 combines enrollments and graduates in the West. It shows that school enrollments in grades one to 12 increased steadily between 2000-01 and 2005-06 and that the increase will be sustained through 2010-11. Overall, growth will add more than 257,000 students to public schools in the West by the end of the projected period, an increase over 2005-06 of 2.3 percent.

Enrollments in high schools will experience three phases of change between
Figure 2.9. Births in the West, 1981-2004

[^1]2005-06 and 2018-19, the last year for which high school enrollments could be projected. The first two projected years (2006-07 and 2007-08) will continue a trend of expansion, with just over 3.8 million students in public high schools by 2007-08. Next will begin a slow decline that will see the West shed more than 32,000 high school students by 2011-12. Thereafter, the West will see more growth, ultimately topping out with almost 4 million high school students in 2018-19. Projections indicate that enrollment patterns in nonpublic high schools

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

in the West will generally mirror those of public high schools.

## High School Graduates

Between 1991-92 and the last year of actual data in 2004-05, public schools in the West graduated an additional 201,000 students, an overall growth rate of 41.8 percent. That works out to growth roughly equal to
2.7 percent on an average annual basis. By the time that the projections reach a peak regionally in 2008-09, the West is expected to add another 67,344 public graduates, or 9.9 percent. This extremely rapid growth will then come to a halt, and the region can expect to see small, annual drops in graduate numbers until 2015-16, when growth will resume.

Table 2.3. Public and Nonpublic School Enrollments and Graduates, West

Projected Figures

## State Perspectives

A closer look at the individual states reveals more details about which states are driving the regional patterns discussed above. Figure 2.10 shows the percentage change in the number of public and nonpublic graduates for the Western states at three different points in time, all relative to 2004-05. Two states stand out as contributing to the projected growth: Arizona and Nevada. Both have been experiencing dramatic population growth, and projections indicate that they will see their high school graduating classes nearly double in size by 2021-22 if historical trends persist. Estimates for the average annual increase in graduating class size throughout the projected period for Arizona's public schools is 3.6 percent, while for Nevada it is 4 percent. While Nevada's rate of growth is slightly higher, Arizona contributes more momentum to overall regional growth because it is a much larger state. Other Western states that can expect to see big changes in their public school graduating classes by 2021-22 include Colorado (29.3 percent), Idaho (39.1 percent), and Utah (42.4 percent). By 2021-22 California will also have expanded and, while its increase will add substantially to the West's total growth, it will represent only a 6.6 percent gain for the state. However, in the short term, California's public graduating classes will swell considerably, peaking in 2007-08 after having grown by more than 33,000 students ( 9.4 percent) since 2004-05. In fact, the number of public school graduates in California is not expected to reach that height again in these projections.

Figure 2.10. Percent Change (Relative to 2004-05) in the Total Number of Projected High School Graduates in Western States

Counterbalancing rapid growth in these Western states are several others that are facing the opposite challenge: dwindling projections of high school graduates. Western states expecting to see an overall decline during the next 17 years include: Montana, North Dakota, South Dakota, and Wyoming. Of these, North Dakota is forecast to see its graduating classes diminish the most, by about 20 percent. Postsecondary institutions in states where demand from traditional-age students is falling may struggle to maintain enrollments and, with reduced enrollment-based state appropriations and fewer tuition dollars, may see quality suffer. In between are a few states where high school graduates projections are mostly stagnant or growing slowly, including Alaska, Hawaii, New Mexico, Oregon, and Washington.

Figure 2.11 provides another view of projected regional change in the number of total high school graduates at three different points in time, with the total regional change disaggregated by state. That is, the figure illustrates how changes in the projections in each of the Western states' total number of high school graduates contribute to the projected regional change. As indicated by the leftmost graphic, in 2009-10 the states in the West are projected to collectively graduate about 70,000 more high school students than they did in 2004-05 (the "height" of the column net of the "depth" of the column). Of that increase, the states that will provide the biggest boosts will be Arizona and California, followed by Nevada, Washington, Colorado, and Utah. North Dakota, South Dakota, and Oregon are projected to lose graduates, and so their contributions are shown as negative. Looking ahead to 2014-15, the contribution from Arizona to the regional increase grows to exceed California's, and Colorado, Nevada, and Utah will each add more graduates to the regional total than Washington. Several states' high school graduate numbers will fall, so their contribution to the regional total will be negative. These states include: Montana, New Mexico, North Dakota, Oregon, South Dakota, and Wyoming. By 2020, the regional change is

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

much greater and the additional growth is fueled mostly by larger increases in Arizona, Nevada, Colorado, and Utah, while Idaho is also projected to make a strong contribution to growth by then.

The long-term view conceals differences in the shorter term that are actually less speculative and also contribute to the challenges facing some states. For instance, projections suggest that Alaska's public schools will graduate more students in 2010 than they did in 2005. So as Alaska's public

Figure 2.12. Births in the Midwest, 1981-2004

[^2]education leaders are considering ways to serve a small upwelling of demand among traditionalage students, they must simultaneously be thinking about the subsequent, mild erosion of high school graduating classes (if historical trends persist). Furthermore, in most Western states, the bulk of the projected growth (or the moderation of the projected decline) is expected in the shorter term.

## Midwest

Struck by the departure of a large segment of the manufacturing industries that drove the economies of many of its states, the Midwest has been experiencing out-migration and stagnant population growth overall. Between 1995 and 2000, states in the Midwest lost a total of 541,189 former residents to states in the other regions, a loss of 9.1 individuals per 1,000 population. ${ }^{9}$ During the first four years of the new century, net migration was responsible for a continued decline in population as the Midwest lost an estimated 10 residents per 1,000 population to other regions. ${ }^{10}$ This, in combination with a birth rate that, despite considerable fluctuations, has trended downward substantially since 1981 (Figure 2.12), lays the

Chapter 2. Projections of High School Graduates

## Knocking at the College Door

context for the enrollments and graduates projections that follow.

## Elementary and Secondary Enrollments

Table 2.4 shows actual data and projections for total school enrollments, high school enrollments, and high school graduates in the Midwest. It indicates that, during the projected period, public schools in the region can expect to see mostly a drop-off in overall numbers,
which will decline by nearly 160,000 between 2005-06 and 2010-11, or 1.7 percent. Estimated enrollments in all grades in nonpublic schools crested in 2001-02 and will continue to fall throughout the projection period. Ultimately, by 2010-11, nonpublic schools in the Midwest are projected to have only 87.6 percent of the students they served during 2001-02.

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

begin to pick up again the following year. Enrollments at Midwestern nonpublic high schools are projected to fall off even more dramatically, with an average annual decline of over 1.1 percent between 2001-02 and 2013-14.

The picture for the Midwest's high school enrollments is a little less bleak, if only because more years are projected, allowing the region to recover somewhat from early declines. After 2005-06 public high school enrollments will enter an extended slump, shedding almost 162,000 students, or 4.9 percent, by 2013-14. But enrollments will

Figure 2.13. Percent Change (Relative to 2004-05) in the Total Number of Projected High School Graduates in Midwestern States

Figure 2.14. Contribution to the Midwest's Change in Total High School Graduates (Relative to 2004-05) by State

en el e

## High School Graduates

Graduates from public high schools in the Midwest will follow a similar pattern as total enrollments, although the number of graduates will continue to rise initially in the projections period. By 2007-08, the number of public high school graduates will peak at about 703,000. Seven years of declines will follow, and the Midwest will eventually lose over 50,000 public school graduates by 2014-15, or 7.1 percent.
The number of graduates from nonpublic schools in the Midwest reached its peak in 2002-03 at just shy of 71,000 and is projected to fall by almost 16,000 (22.4 percent) by 2014-15

## State Perspectives

 Leading up to 2007-08, the individual states in the Midwest region will mostly see an initial bump in projections, with all but Kansas experiencing some growth. For most, this growth will be relatively manageable; Indiana is the only Midwestern state with a projected increase greater than 10 percent in the public sector over the three years from 2004-05 to 2007-08.However, all of the Midwestern states are expected to contribute to the decline in public school graduates between 2007-08 and 2014-15, and the drop will be especially large in a few states. The decline will be greatest

## Knocking at the College Door

in Michigan, whether one looks at raw numbers or percent change: Michigan will lose a projected 14,606 public school graduates during that time frame, or about 13.2 percent. In addition, Kansas, Minnesota, and Wisconsin can also expect to see the size of their respective public school graduating classes cut by over 8 percent, with Nebraska and Ohio not far behind at more than 7 percent. Projected to be down by over 9,000 graduates, Ohio will be the second biggest loss leader in total numbers, followed by Wisconsin and Minnesota, which will both shed more than 5,000. Indiana's forecast indicates that it will emerge from this downturn relatively unscathed, dropping by only about 500 public school graduates, or less than 1 percent, between 2007-08 and 2014-15. (Figure 2.13 shows the percentage change in the number of public and nonpublic graduates for Midwestern states at three different points in time, relative to 2004-05.)

By the end of the projections period, the individual states of the Midwest are expected to have had quite different experiences. Michigan and Ohio can expect to see large decreases by 2021-22 (relative to 2004-05), which, combined, will account for almost 16,000 fewer public high school graduates. Indiana will see a robust expansion in the number of graduates, with a 16.1 percent increase; and lowa (6.7 percent) and Missouri (5.9 percent) also have long-term forecasts for notable growth.

The size of graduating classes from the Midwest's nonpublic sector will also vary by state. Where the number of nonpublic graduates falls, it is forecast to shrink substantially. By 2021-22, the decrease will be roughly 23.5 percent in Illinois, 21.4 percent in Kansas, 37.8 percent in Michigan, 19.4 percent in Nebraska, and 22.8 percent in Ohio. Growth in the number of nonpublic graduates in the other states will be very modest by comparison. Even in Indiana where the percent increase is 9.4 , the number of nonpublic graduates will rise by less than 700 over projections for 2004-05.

Figure 2.14 provides an illustration of how
projected changes in total high school graduates in the individual states combine to determine the projected regional change. It indicates that by 2010, the states driving most of the regional increase will be Illinois, Indiana, Missouri, and Ohio, while declines in Kansas will be limiting overall regional growth the most. The story changes dramatically, however, when looking at the class of 2015. Growth projected for Indiana and - to a lesser extent - lowa, will be overwhelmed by reverses in all the other states, but particularly in Michigan and Ohio. By 2019-20, Missouri and Nebraska join Indiana and Iowa on the positive side of the ledger, but sizeable decreases in Michigan and Ohio will continue to drag the total regional projection downward.

## Northeast

If the demographic future presented above for the Midwest in terms of school enrollments and graduates seems gloomy, the Northeast's looks worse: the region will face even more significant and persistent declines in school enrollments and graduates. Overall, the Northeast has struggled to retain its existing population. According to data from the last decennial census, and accounting for both in-migrants and out-migrants, the Northeast lost residents to other parts of the country between 1995 and 2000 at a rate of 25.5 people out of every 1,000. ${ }^{11}$ That trend persisted into the early part of the $21^{\text {st }}$ century, though estimates suggest the hemorrhaging was somewhat reduced, with the Northeast losing approximately 18.4 per 1,000 population between

Figure 2.15. Births in the Northeast, 1981-2004

Source: National Center for Health Statistics, Centers for Disease Control and Prevention.

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

2000 and 2004. ${ }^{12}$ Meanwhile, the number of births in the Northeast went into relative freefall in the early- to mid-1990s (Figure 2.15). Annual births regionwide fell by more than 197,000 between 1989 and 1997, a drop of 22.3 percent. There has not been a consistent pattern in the number of births in the Northeast since then, but overall the region has continued on a more modest downward trend.

Elementary and Secondary Enrollments
Public school enrollments in all grade levels in the Northeast region topped out in 2004-05 at more than 7.4 million (Table 2.5). Since then the region has begun a steep decline that shows little sign of stopping: enrollment numbers are projected to fall by nearly 348,000 students ( 4.7 percent) by 2010-11. Nonpublic school enrollments in all grades also contribute to the overall decline: having peaked even earlier, in 2001-02,

Knocking at the College Door
they are projected to fall by almost 156,000 students, or 13.2 percent. In a region that prides itself on its large number of nonpublic schools (at the K-12 as well as the postsecondary level), the share of nonpublic enrollments in all grades will decline from 13.8 percent in 2001-02 to a projected 12.6 percent in 2010-11.

A similar story is apparent when looking at high school numbers. Enrollments in the public sector will begin a persistent decline in 2007-08, resulting in a reduction of 9.5 percent by 2018-19. Nonpublic high school enrollments are also projected to fall precipitously, with the decline beginning in 2005-06. The slump will eventually reduce enrollments by 17.4 percent by 2018-19 but will be steepest between 2006-07 and 2013-14. In those seven years, nonpublic high school enrollments will fall by over 58,000 students (16.1 percent). The share of high school students served by nonpublic schools is expected to fall from 13.4 percent in 2000-01 to 11.6 in 2014-15. These projections assume no major changes in historical trends in schooling choices, but a forecasted decline this dramatic will likely threaten the existence of some schools in the nonpublic sector. Consequently, it will be surprising if nonpublic schools do not adjust policies - such as those relating to tuition or admissions - in order to survive. Such changes will likely target public school students in the region, which would tend to exacerbate the projected decreases in that sector.

## High School Graduates

Public high schools in the Northeast have been graduating an increasing number of students since 1993-94; between then and the projections peak year in 2007-08, the number grew by almost 129,000 to 537,662 graduates, an increase of 31.5 percent. But projections show that the class of 2009 will be the first of many consecutive classes of shrinking size, leading to an overall decrease of nearly 55,000 (10.2 percent) by 2014-15. In subsequent years, public high school graduates are expected to fluctuate considerably from

Figure 2.16. Percent Change (Relative to 2004-05) in the Total Number of Projected High School Graduates in Northeastern States

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

though, many of the states will see growth in the short term, before the pipeline of students begins to dry up. For instance, between the classes of 2005 and 2008, Connecticut's number of public graduates is forecast to grow by 6.3 percent, Massachusetts's will be up by 5.5 percent, New Hampshire's will rise by about 4.9 percent,

Figure 2.18. Births in the South, 1981-2004

[^3]New York's will climb by 5.7 percent, Pennsylvania's will be up by 6 percent, and Rhode Island's will increase by 5.5 percent. Only Vermont will not see an initial bump in the numbers of public graduates by 2007-08.

Thereafter, however, all of those states will enter a period of shrinking public school graduate numbers, during which most of them will experience their greatest losses. Between 2007-08 and 2014-15, the drops will range from 8 percent in Connecticut to 18.5 percent in Vermont. Even New Jersey will lose about 3.4 percent of its graduates over this time period.

Figure 2.17 illustrates how the regional picture is influenced by projected changes in each of the Northeast's states. The regional growth between 2004-05 and 2009-10 will be fueled mainly by increases in New Jersey, New York, and Pennsylvania. But by the class of 2015, only New Jersey will still have more graduates than it did in 2004-05, while losses in most states, especially in New York and Pennsylvania, will drag the regional total downward. That pattern only worsens by 2020.

## South

The South is the most populous region in the nation and has been adding residents at a tremendous pace. Between 1995 and 2000, the South attracted more than 20 new migrants from elsewhere in the country for every 1,000 people already residing there, even after accounting for those individuals who opted to leave. ${ }^{14}$ All the region's states, except

Chapter 2. Projections of High School Graduates

## Knocking at the College Door

Maryland, West Virginia, Louisiana, and the District of Columbia, experienced positive net migration during that same time frame. More recent estimates suggest that the South's in-migration rate has slowed somewhat, to 13.6 individuals per 1,000 between 2000 and 2004, though the South still added over 1.4 million new residents from other regions. ${ }^{15}$ While the South's growth owes much to migration patterns, the pace of births is perhaps more important. With the notable exception of the period from

1990 through 1995, the number of births in the region has grown each year (Figure 2.18). By 2004, there were almost 365,000 more children born to Southern mothers than there were in 1981, an increase of about 31.5 percent.

## Elementary and Secondary Enrollments

The rapid growth in domestic in-migration in the South, combined with a dramatic expansion in the

number of births, is sure to create capacity challenges for schools and postsecondary institutions in many places throughout the region. Table 2.6 shows actual and projected enrollments and graduates for public and private schools in the South. Public schools can expect to see the continuation of a steady and rapid increase in the number of students at all grade levels through the 2010-11 academic year. Projections indicate that public school enrollments will climb by 656,522 students, an increase of 4.1 percent between 2005-06 and 2010-11. Nonpublic school enrollments are also projected to grow rapidly, at 49 percent between 2003-04 (the last year for which observable data for this sector were available) and 2010-11.

Public high schools in the South will add a projected 550,000 students between 2005-06 and 2018-19, or about 10.5 percent, although annual changes will not be consistently upward throughout the projection period. Most of this projected growth will take place beginning in 2010-11, adding about 519,000 additional students to public high schools by 2018-19. Nonpublic high schools in the region will also see an enrollment increase that is roughly equivalent in percentage terms to the projected enrollment growth in the public schools, with the bulk of the growth expected after 2011-12. Overall, nonpublic high schools are expected to enroll more than 41,000 additional students in 2018-19 than they did in 2003-04.

## High School Graduates

The rapid growth of enrollments in the South will translate into many more high school graduates, if historical trends continue. Near-term projections show a rapid increase in public high school graduates between the classes of 2005 and 2008. This first surge will add an estimated 91,557 more graduates ( 9.6 percent), at an average annual rate of 3.1 percent. After several years in which the number of public high school graduates will remain relatively stable, projections indicate that a swift expansion will begin in 2013-14. This second surge is projected to add almost 124,000 more graduates (12.1 percent) between then and 2021-22.

Multiyear patterns in the projections for graduates from nonpublic high schools in the region are less clear, with annual changes almost alternating between increases and declines. However, by 2021-22, graduates from nonpublic schools are projected to number over 12,000 more than they did for the class of 2003 (a 13.6 percent increase), which was the last available year of observable data for this sector.

## State Perspectives

Figure 2.19 shows the percentage change in the number of public and nonpublic graduates for the Southern states at three different points in time, relative to 2004-05.
Unlike the other regions, where it is mostly the case that the number of public high school graduates in each state will reach a peak more or less all at the same time, around 2007-08 or 2008-09, the pattern is less clear in the South. To begin with, there is the case of Louisiana. There, initial evidence indicates that the aftereffects of Hurricane Katrina have had a dramatic impact on the projections, resulting in a substantial fall in public graduates. (These projections are built on the first data available on school enrollments post-Katrina, but little is yet known about the long-term effects of the hurricane on enrollments and graduates in affected areas. Readers are cautioned to examine Louisiana's projections in this light. More details and some analysis concerning the projections for

## Knocking at the College Door

Louisiana are available in Chapter 4.) Additionally, the peaks for each state in the South are spread out over a longer time frame than in other regions. That is, the peak year for South Carolina is 2006-07, while the District of Columbia's peak is delayed until 2010-11.
projected for the longer term. But in Alabama, the District of Columbia, Maryland, Mississippi, and West Virginia, some or all of the increase by 2010 is projected to be temporary.Nonpublic school graduating classes are projected to climb along with public school graduates

Lastly, it is unclear whether several states - including Florida, North Carolina, Georgia, and Texas - will experience a peak at all; rather, they may undergo a consistent expansion in high school graduate numbers, with a single year or two during which the growth pattern is momentarily interrupted. In fact, these states, which are also the largest in the South, account for the vast bulk of the regional expansion described above. Between 2004-05 and 2021-22, public graduates are projected to climb by over 47,000 in Florida (a 35.5 percent increase), almost 29,000 in Georgia (40.9 percent higher), over 23,000 in North Carolina (up 30.7 percent), and over 96,000 in Texas (a 40.1 percent rise).

Other Southern states will grow dramatically as well. High school graduates numbers in Arkansas, Delaware, and Virginia will grow by about 20 percent or more. Besides Louisiana, only Maryland and West Virginia are projected to see smaller public graduating class sizes at the end of the projections period, relative to the class of 2005.

In the medium term, all states except Louisiana can expect to see increased public graduates by 2010 . Generally, these gains are just part of the growth

regionwide, with several exceptions. Louisiana is the most obvious one, though the decline in graduates from nonpublic schools may be much less substantial than declines in the public sector there. Other states will also have shrinking nonpublic school graduating classes between 2002-03 and 2009-10, including Mississippi ( 23.7 percent), Oklahoma ( 34.3 percent), South Carolina ( 18.6 percent), Tennessee ( 8.9 percent), and Texas ( 12.8 percent). Mostly, the short-term projections for nonpublic graduates are part of an upward (though uneven) trend that is predicted to reach into the third decade of the $21^{\text {st }}$ century. Kentucky represents the exception, where by 2021-22 the number of nonpublic graduates is forecast to have fallen by 10.8 percent from 2004-05, more than reversing a short-term gain in that state.

Figure 2.20 shows the projected regional change in total high school graduates, as disaggregated by state, for three different time periods. It shows that the bulk of the growth in the South is attributable to Texas and Florida, with North Carolina and Georgia accounting for most of the remaining increase.

## Summary

Nationally, these projections indicate that the number of high school graduates will rise through 2007-08, continuing a trend that began more than a decade ago. After that, the number of graduates will dip for several years before starting to increase again around the middle of the second decade of the century. Yet the four geographic regions, as well as individual states, will face very different fortunes over the next decade in terms of the number of graduates they produce from public and nonpublic high schools.

Figures 2.21 and 2.22 illustrate changes in the states over the short term and the medium term. Figure 2.21 shows the change over the first five years of the projections, while Figure 2.22 shows the change over the first 10 years. Together, the two figures point to how dramatically the forecast changes from state to state and how it differs among states over the two time frames. While the first half of the period will clearly be characterized by growth in many places throughout the country, by 2015 decreases will be more widespread. In both figures, a number of states in the West and the South stand out for their rapid growth, especially Nevada and Arizona. By contrast, states in the Northeast, the upper Midwest, and the northeastern part of the West can expect to see their production of high school graduates erode.

## Chapter 3. PROJECTIONS BY RACE/ETHNICITY

The previous chapter examined the ways in which the overall demand for educational services will impact states, localities, and institutions in the years ahead. The key questions relating to educational policies and practices raised by the projections in that chapter mostly centered on issues of providing adequate capacity and preserving quality. This chapter will concentrate on the dramatic changes in demography which are part of that overall demand.

Seismic demographic shifts are remaking the fabric of our society, and they will dramatically alter the racial/ethnic composition of our primary and secondary schools and postsecondary education institutions. Specifically, growth in minority populations, particularly among Hispanics, ${ }^{1}$ is vastly outpacing change in the White non-Hispanic population. The nation is in the process of transitioning from one in which a single racial/ethnic group predominates to one that has no single race/ethnicity that can claim a majority of the population. ${ }^{2}$ Some states, including California, Hawaii, New Mexico, and Texas, are already majority-minority (where less than 50 percent of the population is White non-Hispanic), and more are poised to follow within a short time. This is due in large part to the fact that White non-Hispanic women have a lower fertility rate than Black non-Hispanic and Hispanic women (Figure 3.1). In addition, the fertility rate among Hispanics has been increasing in recent years, while the fertility rate for Black non-Hispanics and White non-

Hispanics has been flat or declining. ${ }^{3}$ Also, immigration into the United States in recent years has been dominated by individuals from Latin American countries, intensifying the demographic changes already underway. ${ }^{4}$

In response to these developments, educational providers and policymakers will need to examine how existing educational systems and policies must be reformed in order to better serve fast-growing but historically underserved populations, especially Hispanics. Persistent gaps in educational attainment levels are the legacy of our nation's past failures to more effectively reach minority populations. These projections are clear evidence that vast improvements in how our nation and individual states meet the educational needs of minorities are imperative for competitiveness and prosperity in a global economy that is increasingly driven by a society's accumulated knowledge and skill. Thus, the projections described in this chapter will ideally lead states, localities, and institutions to explore new ways to deliver quality curricula, effectively assess performance, provide sufficient academic support, conduct outreach, and the like.

Unlike the previous chapter, this analysis will focus solely on the population of individuals attending public schools, a restriction necessary because data on nonpublic school enrollments and graduates disaggregated by race/ ethnicity are not available in any consistent manner across the nation. Data on homeschooled students are also not included, for the same reason. Thus, the data and projections described here capture the large majority of school enrollments and graduates from the traditional educational pipeline - but not all. It is worth noting that student bodies at nonpublic schools and homeschooled students across the nation are disproportionately White non-Hispanic (Table 3.1). ${ }^{5}$

## National Trends

 Nationally, White nonHispanic mothers give birth to the most children as a group (Figure 3.2). But over the past decade and a half, the number of White non-[^4]Figure 3.1. Fertility Rates by Race/Ethnicity

## Knocking at the College Door

Hispanic births has declined steeply while the number of births in almost all other racial/ethnic groups has risen - so much so that by 2004, the difference between the number of White non-Hispanic births and the number of minority births had shrunk to a little over 500,000, down from 1.25 million in 1990. White non-Hispanic births fell by 15.1 percent over this time period, while Hispanic births grew by 56.7 percent. Births among Asians/Pacific Islanders were up even more dramatically ( 58.2 percent), but their relatively low numbers reduce their impact on the overall trend. Finally, the number of Black nonHispanic births dropped almost as steeply as the number for White non-Hispanics (14.1 percent).

This relative change in the number of births is a major factor in the demographic shifts taking place. But immigration is also diversifying our national population. According to the U.S. Census Bureau, foreign-born individuals who emigrated to the U.S. between 2000 and 2006 numbered an estimated 7.6 million new residents. ${ }^{6}$ Most of the new residents came from Latin American countries, especially Mexico. ${ }^{7}$

## Public Elementary and Secondary Enrollments

The increasing racial/ethnic diversity in our nation is very evident in data and projections for enrollments at our public schools. Table 3.2 shows the actual number of pupils by race/ethnicity for the academic years 2000-01 through 2005-06, with projections through 2010-11. It indicates that in just the five years preceding 2005-06, all racial/ethnic groups except White non-Hispanics experienced growth, and the number of Hispanic students grew especially fast, with 1.8 million new students (a 26 percent increase). Looking ahead, rapid growth in Hispanic enrollments is expected to continue, as are decreases in the White non-Hispanic population. By 2010-11, the number of students of Hispanic origin will climb by another 1.8 million, while the number of White non-Hispanics will fall by 1.5 million. The number of Black nonHispanic students at all grade levels is forecast to peak in 2006-07 and then begin a gradual decline.

To obtain a longer view of enrollment change than is possible by looking at all grade levels (since births are not projected), Table 3.3 examines enrollments in public high schools by race/ethnicity. It tells a similar story, with continued growth among Hispanic students. By 2018-19, the number

Actual Figures

## Knocking at the College Door

of Hispanic high school students nationwide will have more than doubled from its 2001-02 level, increasing its composition of enrollments from 14.5 to 27.2 percent. This growth will offset declines in the number of White non-Hispanics enrolled at public high schools. These projections indicate that our nation's public high schools will become majorityminority in 2018-19, when the share of high school students who are White non-Hispanic is expected to fall below 50 percent for the first time. Also growing will be the proportion of enrollments among Asian/ Pacific Islanders, while the share of Black non-Hispanic students is forecast to peak in 2007-08 and then decline.

## High School Graduates

Similarly, the rapid demographic diversification evident in the enrollment projections will have profound effects on the nation's supply of high school graduates. Figure 3.3 shows how the composition of the nation's graduating classes is forecast to change in the years to come, especially by highlighting how the steep decline in the number of White non-Hispanics will be almost completely offset by growth in the number of Hispanic graduates. Similarly, the decline in the share of Black nonHispanics will be fully balanced by growth in the proportion of Asians/Pacific Islanders. The projected result is that White nonHispanic high school graduates are expected to decline toward 50 percent of the graduating class, but won't quite reach that watermark by 2021-22.

Figure 3.4 presents data on high school graduates by race/ethnicity in another way that highlights the rapid growth among Hispanics and Asian/Pacific Islanders and contrasts that growth with decreases among graduates of White non-Hispanic descent. It shows the cumulative percent change in graduates, using 2004-05 (the last

Figure 3.4. Cumulative Percent Change in U.S. Public High School Graduates Relative to 2004-05 by Race/Ethnicity

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

year of actual data) as the base year. The graph indicates that, for instance, in 2009-10, the number of high school graduates of Hispanic descent will be approximately 32.5 percent higher than in 2004-05; by 2014-15, that number will have reached about 54.3 percent, and so on. (Because it is expressed in percentage terms, the growth or decline represented is specific to each racial/ethnic group individually.)

Thus, the graph indicates that all race/ethnicities will see growth initially in the projections. But after 2007-08, three groups will begin a period in which their numbers will stagnate or fall. While the declines among Black nonHispanics and American Indians/Alaska Natives will never make their number fall back to their 2004-05 levels, by 2009-10, the number of White non-Hispanic graduates will have declined below that level and will continue to fall throughout the projected period. Meanwhile, the number of Hispanics and Asians/Pacific Islanders are forecast to experience a rapid and mostly uninterrupted climb throughout the projection period. By 2019-20, the increase in Hispanic graduates will have reached 90 percent, and Asians/Pacific Islanders will have grown by about 63 percent.

## Regional and State Trends

These national demographic changes will play out very differently across the regions and in individual states. However, any differences will generally be a matter of degrees, rather than of incongruence with the overall patterns. That is, regional and statewide patterns are mostly consistent in moving toward greater diversity, though the actual magnitude to which the racial/ethnic composition of public school enrollments and graduates is changing varies, as does the speed at which it is changing.

Once again, births data herald significant change in enrollments and graduates in the years to come. In all four regions, the proportion of children born to White non-Hispanic mothers fell substantially between 1990 and 2004. In the West, the share fell from 54.2 percent to 44.3 percent, highlighting the fact that White nonHispanic babies were in the minority in recent years. In the Midwest, it dropped from 78.5 percent to 72.3 percent. In the Northeast, it fell from 69.5 percent to 62 percent. And in the South, it declined from 61.7 percent to 52.8 percent.

Migration is also important, but data on migration by
race/ethnicity are less widely available. The foreign-born population has tended to concentrate mostly in the West, as indicated by the estimates in Table 3.4. ${ }^{8}$ It shows that those born in Latin American countries most commonly settle in the West or the South. Immigrants from Asia are more numerous in the West than in other regions, while those from Europe have tended to concentrate in the Northeast.

Domestic migration also shifts the racial/ethnic composition of the population. Between 1995 and 2000, the South experienced the highest net migration rates for all races/ethnicities except American Indians/ Alaska Natives. Meanwhile, the West also experienced positive net migration among Asians/Pacific Islanders, White non-Hispanics, and Black non-Hispanics, although it lost more Hispanic residents than it attracted from elsewhere. Hispanics destined for states in the Midwest outnumbered those leaving that region, but the Midwest saw losses in all other racial/ethnic groups. The Northeast saw losses in all racial/ethnic groups over that time frame. ${ }^{9}$

## Public Elementary and Secondary School Enrollments

 Tables 3.5 to 3.9 display actual and projected enrollments for each racial/ethnic group in public schools in each of the geographic regions at all grade levels and for grades nine to 12. Table 3.5 shows that American Indians/Alaska Natives are most numerous in the West, followed by the South. Projections indicate that enrollments among American Indians/Alaska Natives are expected to show substantial change only in the South. There, enrollments are forecast to grow by about 10.1 percent from 2005-06 to 2010-11 in all grades and by about 26.4 percent in high schools between 2005-06 and 2018-19.Table 3.6 provides the same data for Asians/Pacific Islanders. Enrollments among students from this group are projected to grow rapidly in all four regions. Between 2005-06 and 2010-11, projected growth in the West will add 100,000 students of Asian/Pacific Islander descent (9.8 percent), while the Midwest will add nearly 60,000 (23.8 percent), the Northeast will add almost 72,000 (19 percent), and the South will add almost 132,000 (32.4

| 2018-19 |  |  |  |  | 446,509 | 144,595 | 194,658 | 277,273 |

Note for Tables 3.5 and 3.6: Enrollments by region may not sum to the total enrollment for each race/ethnicity found in Tables 3.2 and 3.3 because the nation and each region were projected separately.

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

percent). Similarly, rapid growth is projected for high school enrollments among Asians/Pacific Islanders, whose numbers will grow consistently in all four regions.

Enrollments among Black non-Hispanic students will be down in all regions in the years to come, despite initial projected increases among high school students, especially in the South and the Midwest (Table 3.7). After 2007-08, high school enrollments will begin declining (total enrollments will already have begun a descent), with decreases by 2018-19 reaching about 34,000 in the West (13.9 percent), 72,000 in the Midwest (14.4 percent), and 68,000 in the Northeast (17.9 percent). Only in the South, which is projected to enroll almost 47,000 fewer Black non-Hispanic high school students in 2011-12 than it did in 2005-06, is there expected to be any recovery in the number of Black non-Hispanics enrolled in public schools as the decade closes. Yet even then, the South will enroll fewer Black non-Hispanic students than it did in its peak year.

Consistent with all other projections, enrollments among Hispanic students will show tremendous growth in all four regions, although the vast majority of Hispanics are concentrated in the West and South (Table 3.8). Enrollments of Hispanics in all grades are projected to rise
by over 540,000 (13.9 percent) in the West and by about 957,000 (33.3 percent) in the South between 2005-06 and 2010-11. Although the Midwest will add fewer Hispanic students, 237,000, its growth rate is similar to the South's at 33.1 percent. In the Northeast, Hispanics are projected to increase during that time frame by approximately 104,000 additional students at all grades (equal to 10.3 percent growth). There are no signs that increases in the number of Hispanic students are likely to slow much, as enrollments in the high school grades are also expected to grow constantly through 2018-19.

Finally, Table 3.9 shows actual and projected enrollments among White non-Hispanic students. It indicates that all four regions are projected to see steady enrollment declines between 2005-06 and 2010-11 in all grade levels. That decline will cost the West about 380,000 students ( 7.6 percent), while over 400,000 students will be lost in both the Midwest ( 5.8 percent) and the Northeast (8.3 percent), and over 300,000 in the South (3.6 percent). Looking at high school enrollments, the story is much the same: the regions, except for the South, can expect a steady and continued decline in their enrollments of White non-Hispanic students through 2018-19. Only in the South is that downward-sloping trend line meaningfully interrupted at all. For two years,

Table 3.7. Enrollment of Black non-Hispanics by Region

Note for Tables 3.8 and 3.9: Enrollments by region may not sum to the total enrollment for each race/ethnicity found in Tables 3.2 and 3.3 because the nation and each region were projected separately.

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

2013-14 and 2014-15, White non-Hispanic enrollments will temporarily climb in the South, only to immediately begin falling once again in 2015-16, ultimately reaching their lowest point in the last year projected.

Figures 3.5 to 3.8 show how these changes in enrollments will affect the racial/ethnic characteristics of public school enrollments in each of the four regions. In all regions, the share of students who are White nonHispanic will decline substantially and will mostly be replaced by Hispanic students. By 2010-11, the South can expect to see the representation of White non-Hispanic students in all its public schools shrink below 50 percent, leaving the region with no majority race/ethnicity in enrollment. In the West, the share of all public school students from Hispanic descent will almost equal the share of White non-Hispanics. Additionally, the share of Black non-Hispanic students is projected to shrink slightly, and the share of Asians/Pacific Islanders is expected to rise across all regions.

These broad regional patterns are sure to be unevenly felt at the level of individual school districts or schools, with some seeing virtually no change and others beset by constant change. But this rapid diversification at the regional level nevertheless calls for attention from state and often local policymakers and educational leaders regarding how curricula and educational delivery may need to be adjusted to accommodate students from varying cultural traditions. Many of these students are from families occupying lower rungs on the socioeconomic ladder, are more likely to speak English as a second language, and come from backgrounds historically underserved by our education system.

## Public High School Graduates

Building as they do on enrollments data, the regional projections for high school graduates also reflect rapid diversification. Because data tables showing high school graduates by race/ethnicity for the nation, the four geographical regions, and all 50 states and the District of Columbia can be found in Appendix A, this section will concentrate on graphical representations of the projections and associated analyses.

Figure 3.9 shows the total number of public high school graduates in the West, disaggregated by race/ethnicity. It shows that the West will see increases in its public schools' production of high school graduates, that the majority of the growth will be among Hispanics, and that the number of White non-Hispanic graduates will decline, especially in the years after 2007-08. Figure 3.10 highlights these demographic shifts by showing the cumulative percentage change in the number of public high school graduates by race/ethnicity in the West
over the coming years. While the number of Hispanic graduates is on an uninterrupted climb throughout the projected period, the increase in the number of White non-Hispanic graduates will reach its zenith in 2007-08, after which it is expected to fall substantially throughout the projection time frame. Additionally, the number of Black non-Hispanic graduates coming out of public high schools will be up relative to the 2004-05 level throughout the decade to follow, but will ultimately dip slightly below that level beginning in 2018-19. Asians/ Pacific Islanders will also show considerable growth and American Indians/Alaska Natives, who are most concentrated in the West, will also climb above their 2004-05 level, though with less consistency than other groups.

In the Midwest, the decline in public high school graduates that begins after 2007-08 is the result of a large decrease in the projected number of White nonHispanic graduates (Figure 3.11). During the same time frame, the Midwest is forecast to see growth in the number of Hispanic graduates, but not enough to overcome the loss in the number of White non-Hispanics. Figure 3.12 shows cumulative changes following the 2004-05 graduating class in percentage terms. It shows that graduates from all races/ethnicities are expected to grow at first, with Hispanics and Black non-Hispanics seeing the fastest initial growth. Only among Hispanics and Asians/Pacific Islanders will the growth pattern continue. By 2014-15, the number of Hispanic high school graduates in the Midwest will be almost threequarters higher than it was in 2004-05, and graduates of Asian/Pacific Islander descent will have increased by nearly 40 percent. Black non-Hispanic graduates will number barely more that year than in 2004-05, while graduates from both American Indian/Alaska Native and White nonHispanic backgrounds will be down by about 10 percent. The number of American Indian/Alaska Native graduates in the Midwest is forecast to rally in subsequent years, however.

The Northeast's dramatic projected decline in high school graduates overall is clearly the result of decreasing numbers of White non-Hispanic and Black non-Hispanic graduates, as illustrated by Figures 3.13 and 3.14. Like other regions, the Northeast is forecast to see growth in the first few years of the projections before the bottom drops out, beginning in 2008-09. Within the two years that follow, the number of White non-Hispanic graduates will fall below the 2004-05 levels: their numbers will plummet 12.7 percent by 2014-15 and 18.2 percent by 2019-20. Meanwhile, the production of Black nonHispanic graduates will climb through 2009-10, by which time their numbers will be 11.6 percent higher than in 2004-05; but this group will also then begin a

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

long fall that is ultimately expected to result in a loss of about 10 percent (relative to 2004-05) by the end of the projected period. The number of Hispanic graduates in the Northeast will be continually climbing throughout the projection time frame, but their pace of growth is forecast to be considerably slower than in the other regions. The rate of forecasted growth among Asians/Pacific Islanders will outpace that of Hispanics in the later portion of the projected period.

Finally, Figure 3.15 illustrates how the South's dramatic growth curve with respect to public high school graduates is essentially the result of explosive growth among Hispanics. Especially notable is how decreases in White non-Hispanic graduates are more than accounted for by increases in Hispanic graduates. Indeed, the number of Hispanic high school graduates in the South will grow at the fastest pace of all racial/ethnic groups in all regions. By 2016-17, the South's production of Hispanic public high school graduates will just about double the amount produced just 12 years previously (Figure 3.16), adding over 125,000 new graduates to the regional total.

While substantial growth in Hispanic graduates is the major factor driving changes in the total number and racial/ethnic composition of the region's graduates, the South also will produce more graduates from the other races/ethnicities (besides non-Hispanic Whites). But the projected growth

## Knocking at the College Door

those groups' numbers of high school graduates in 2004-05 were small compared to the other groups, so their increases will have only a modest impact on the region's aggregate growth.

Despite the projections showing rapid diversification, the projected share of White non-Hispanic high school graduates in each region is higher than their proportion of the public school student population as a whole. This overrepresentation in graduates is largely because the growth in minority enrollments is greatest in the earlier grades. But it also reflects that fact that minority students (except Asians/Pacific Islanders) are less likely to complete high school than are White non-Hispanic students. ${ }^{10}$ Ultimately, the patterns presented above will lead to big increases in the proportion of Hispanic students in high school graduating classes in all four regions, increases that will offset, to varying degrees, the declining share of White non-Hispanics.

In the West, White nonHispanics, who made up about 55 percent of the graduating class in 2004-05, will see that proportion drop by about 10 percent in just 10 years (Figure 3.17), with Hispanics almost completely replacing them. The other racial/ethnic groups are projected to mostly maintain their shares in the decade ending in 2014-15, with a small decline among Black non-Hispanics, made up for by growth in Asian/ Pacific Islander graduates.

The proportion of graduates of White nonHispanic descent will decline from 81 percent to 76 percent in the Midwest over the decade following 2004-05 (Figure 3.18), and from 74 percent to 68 percent in the Northeast (Figure 3.19). In both regions, these decreases

Figures 3.17, 3.18, 3.19, 3.20. Composition of Public High School Graduates by Race/Ethnicity 2004-05 (Actual), 2009-10 and 2014-15 (Projected)
American Indian/Alaska Native

Black non-Hispanic
Hispanic
White non-Hispanic

White non-Hispanic

## Knocking at the College Door

will be offset by growth in the proportion of Hispanic graduates, which is projected to climb from 5 to 8 percent in the Midwest and from 9 to 13 percent in the Northeast, and by growth in the share of Asians/Pacific Islanders. In the South, the proportion of White non-Hispanic graduates will fall from 60 percent to 51 percent over the same time frame, while the share of Hispanic graduates will fill in the resulting gap as it swells from 13 percent to 22 percent (Figure 3.20).

## Racial/Ethnic Groups

It is abundantly clear that all four regions are feeling the impact of the demographic shifts taking place today, and they will continue to do so throughout the coming years. Indeed, few states will escape the necessity of having to take a critical look at the way they structure and deliver education in order to meet the needs of a rapidly changing population.

Yet the momentum behind these demographic shifts is concentrated in some states more than in others. For instance, the flow of additional school enrollments and graduates among Hispanics is heavier in states that already have relatively large Hispanic populations, although even states with comparably little experience working with Hispanic students will see dramatic growth relative to their existing student populations. Therefore, this section presents a series of maps that are intended to describe the existing racial/ ethnic composition of each state's cohort of high

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

## American Indians/Alaska Natives

American Indians/Alaska Natives represent the smallest of the racial/ethnic groups examined in this publication, and Figure 3.21 shows that they were more densely
concentrated in the graduating class of 2005 in the West and in Oklahoma than elsewhere. Projections indicate, however, that several of the states with larger concentrations are likely to see decreases in their production of graduates

from that demographic (Figure 3.22). Montana, North Dakota, and New Mexico are among the states with heavier concentrations of American Indians/Alaska Natives that are forecast to see declines in graduates. On the other hand, projections show increases in Oklahoma and Arizona, two other states with relatively large American Indian/Alaska Native populations.

Figure 3.23 exhibits the average annual rate of change among American Indian/Alaska Native graduates. While the numbers of these students may be low and obvious geographic patterns are not readily apparent, several states - especially Arkansas and Delaware are projected to see fast changes with respect to the production of graduates from this background.

Asians/Pacific Islanders Asians/Pacific Islanders who graduated from public high schools in 2004-05 were found in denser concentrations in coastal states than in the interior of the nation (Figure 3.24). That year, they accounted for more than 10 percent of all graduates from public high schools in just two states: Hawaii, where they were a large majority, and California. Washington, D.C., and seven other states - Alaska, Maryland, Nevada, New Jersey, New

## Knocking at the College Door

York, Virginia, and Washington - had shares between five and 10 percent. Several of those same states will continue to add larger numbers of graduates from this group than other states: California, Nevada, New Jersey, New York, and Virginia will be joined by Florida and Texas

as states that will see their number of public high school graduates of Asian/Pacific Islander descent climb by more than 2,500 between 2005 and 2015 (Figure 3.25). Only Louisiana, Massachusetts, South Dakota, and Rhode Island are forecast to produce fewer Asian/Pacific Islander graduates in that period. A vast swath of states in the center of the country, spanning three regions (the West, the Midwest, and the South), will show only modest increases of less than 1,000 Asian/Pacific Islander graduates.

Nationally, Asians/Pacific Islanders are projected to see the second-fastest growth rates among all racial/ethnic groups (Figure 3.26). Only four states will see a negative average annual growth rate over the decade following 2004-05: Hawaii, Louisiana, Massachusetts, and Rhode Island. ${ }^{11}$ Arizona, Nevada, and Arkansas can expect the biggest increases in Asian/Pacific Islander numbers, and the southern tier of states generally (other than Louisiana) will see the fastest average annual growth, relative to 2004-05 levels. Even the Northeast states, aside from Rhode Island and Massachusetts, will produce Asian/Pacific Islander graduates at a significantly increased rate.

## Black non-Hispanics

Public high school graduates who are Black non-Hispanic are more densely concentrated in eastern half of the nation than elsewhere, particularly in the Southeast, where they accounted for 10 percent or more of the high school graduating class of 2005 in all states except

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

West Virginia and Kentucky (Figure 3.27). Many of these states had concentrations exceeding 30 percent, including Alabama, Georgia, Louisiana, Maryland, Mississippi, and South Carolina. In several states along the Eastern Seaboard, including Maryland, Delaware, New Jersey,

New York, and Connecticut, as well as in Pennsylvania and the District of Columbia, Black non-Hispanics represented at least 10 percent of public graduating classes. The same held true in four Midwestern states: Ohio, Michigan, Missouri, and Illinois. The only public high school graduating classes in the West in which Black non-Hispanics had at least a 5 percent share were in California and Nevada.

Figure 3.28 shows the change in the number of Black non-Hispanic public high school graduates projected to occur in the decade following 2004-05. Geographic patterns are less clear for members of this population. For instance, Georgia is projected to have one of the largest increases over that time frame, but two of the states it borders (Alabama and South Carolina) will see declines. Drops will also be seen in the southern part of New England, as well as in New York and California. But most of the states in the country can expect modest increases in the number of Black non-Hispanic graduates from public schools by 2014-15. States showing the fastest average annual growth in Black non-Hispanic graduate numbers by 2014-15 are mostly those that have relatively small Black non-Hispanic populations in the first place (Figure 3.29). States such as Montana, Maine, and North Dakota (for which projections indicate a growth rate exceeding 10 percent per year) will see high rates of growth but very modest increases in the number of Black non-Hispanic graduates. A

## Knocking at the College Door

similar finding is evident for other states posting fastgrowing projected rates, including lowa and states in some parts of the West and the upper Northeast. Many of the states that produce most of the Black non-Hispanic
high school graduates are projected to see little or no average annual change by the end of the decade. And in the Southeast overall, some states' declines will be made up for by others' increases: for instance, South Carolina's projections indicate an average annual decline in its production of Black nonHispanic graduates, but its drop-off will be more than offset by growth in Florida, Georgia, and North Carolina.

## Hispanics

Hispanics in the public high school graduating class of 2005 were much more concentrated in the Southwest and in several other states, such as Texas, Illinois, Florida, New York, Connecticut, and Rhode Island, than they were elsewhere (Figure 3.30). Less than 2 percent of the public high school graduates in large swaths of the Midwest, the South, and the northern New England states were Hispanic.

The number of Hispanic public high school graduates is expected to grow in all states except Hawaii by 2015 (Figure 3.31). But only a handful of states will account for the vast bulk of that growth. Between them, Texas and California will add about 80,000 of the roughly 206,000 new Hispanic graduates, with Arizona, Florida, Georgia, Illinois, Nevada, New Jersey, and North Carolina each adding at least 5,000 Hispanic graduates. Because of the rather larger existing populations of Hispanics in many of those states, however, other states will see a faster pace of growth

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

among Hispanic graduates. Figure 3.32 shows the rates at which such growth is projected to occur. Hispanic graduate numbers will grow especially rapidly in all the states of the South, as well as in several Midwest states. Despite its large share of Hispanic graduates in 2004-05, Nevada still projects rapid growth among those students due to its exploding rate of overall growth. And several other Western states, such as Colorado and Arizona, show a similar combination of high numbers and a fast growth rate (though not as fast as Nevada's).

## White non-Hispanics

Other than in California, Hawaii, New Mexico, and Texas, White non-Hispanic graduates composed the majority of those graduating from public high school in 2005 (Figure 3.33). Moreover, the northern tier states, especially in northern New England and the upper Midwest, generally produced graduating classes with denser concentrations of White non-Hispanics.

Looking ahead to 2015, regional patterns are a little less discernable in terms of changes in the number of White non-Hispanic graduates (Figure 3.34). The bulk of the states are likely to see decreases, with growth isolated in a small and scattered group of states. Only Arizona, Florida, Idaho, Indiana, North Carolina, and Utah are projected to produce more White non-Hispanic public high school graduates in 2015 than they did in 2004-05. Meanwhile, White
non-Hispanic graduates in California in 2014-15 are projected to number almost 40,000 less than they did in 2004-05, and the decline will exceed 10,000 in Illinois, Pennsylvania, New York, and Texas.

## Knocking at the College Door

Figure 3.35 shows how the majority of states can expect to see average annual decreases in their production of White non-Hispanic public high school graduates. The states expected to see the fastest average annual decline

are California, Louisiana, New Mexico, North Dakota, Kansas, Maryland, Oregon, Wyoming, Rhode Island, and Vermont, all of which project annual decreases averaging 2 percent or more. Despite its large population, California sets the pace for the slowing production of White non-Hispanic high school graduates, with a projected decline of nearly 3.2 percent annually, averaged over the decade. But, several states in the South will see little average annual change in the number of White nonHispanic graduates. These will be joined by Indiana and New Jersey outside that region.

## Summary

Demographic shifts underway throughout the nation, all four of its regions, and most of its states are radically changing the racial/ ethnic composition of the student body that public schools will be serving in the years to come. High school graduating classes are diversifying almost as rapidly. Although not all high school graduates go on to college and not all college students are recent high school graduates, such diversification will put pressure on many aspects of postsecondary education to adapt.

States and institutions will have to consider how to ensure that the curriculum being offered is culturally sensitive and responsive. Given historical patterns of academic support and preparation, academic and financial aid advisors will likely see more students with larger deficits in learning and fewer financial

resources available to pay for college when they come to the campus.

States will also need to carefully monitor the distribution of underrepresented students between public institutions. Already, students from non-White backgrounds are much more densely concentrated in the public twoyear sector. Those institutions are often best positioned to distribute educational opportunity most widely, but equity considerations require that students from diverse backgrounds not come to view the two-year sector as the only viable option. However, if larger numbers of minority students reach the threshold of college with greater remedial and financial need, it will be an increasingly difficult task to balance admissions selectivity (and quality) and equal opportunity in the four-year sector. State policymakers and institutional officials will need to be alert to the degree to which all public institutions are serving the increasingly diverse enrollment demand being produced by high schools across the nation.

Leaders in the schools, school districts, colleges and universities, and state government will need to carefully consider how they can provide a quality education to a student body increasingly composed of groups that we as a nation have not historically served very well, lest we find that, in the decade or two to come, our already wide educational attainment gaps have only grown wider.

## Knocking at the College Door

## Endnotes

${ }^{1}$ This publication makes widespread use of "Hispanics" as an umbrella term for individuals from a number of nationalities and origins that typically rely on Spanish as their native language, even though they may share few other cultural traditions. The main reason for this occasionally awkward grouping is because the data used in these analyses are disaggregated in this way.
${ }^{2}$ The U.S. Census Bureau predicts the nation's population will be just 50.1 percent White non-Hispanic by 2050. U.S. Census Bureau, "U.S. Interim Projections by Age, Sex, Race, and Hispanic Origin," accessed 1/9/08 from [http://www.census.gov/ipc/www/usinterimproj/](http://www.census.gov/ipc/www/usinterimproj/). ${ }^{3}$ Joyce Martin et al., Births: Final Data for 2004, National Vital Statistics Reports 55, no. 1 (Hyattsville, MD: National Center for Health Statistics, 2006), 41.

Note that these figures represent interregional domestic migration as defined by the Census Bureau, which includes North Dakota and South Dakota in the Midwest rather than in the West, as this publication does elsewhere. ${ }^{10}$ Angelina KewalRamani et al., Status and Trends in the Education of Racial and Ethnic Minorities NCES 2007-039 (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 2007), 88. Also see Bryan J. Cook and Diana I. Córdova, Minorities in

Higher Education, Twenty-Second Annual Status Report: 2007 Supplement (Washington, D.C.: American Council on Education, 2007), 7. This analysis assumes that existing patterns of high school completion will continue essentially unchanged.
${ }^{11}$ Projections for South Dakota show both a decline in the number of public high school graduates of Asian/Pacific Islander descent and a positive average annual rate of change between 2004-05 and 2014-15. This apparently counterfactual outcome is because of the small number of Asians/Pacific Islanders in South Dakota and the small projected change in graduates from that group.

## Chapter 4. SOURCES AND METHODS

As in the previous editions of this report, our projections of high school graduates rely on a methodology known as cohort survival ratio (CSR). While the focus of this publication is on graduates (which corresponds to WICHE's mission of improving access to postsecondary education), CSR also yields projections of enrollments by grade and total enrollments.

The CSR methodology operates by measuring the difference between the enrollments in a given grade in one year and the enrollments in the next grade level the following year. The same calculation is made for $12^{\text {th }}$ grade enrollments in a given academic year and the number of high school graduates for that year.

Additionally, WICHE calculates a cohort survival ratio between birth and first grade enrollments six years later. Birth data also set the outer limits of the projection time frame: the last year for which graduates are projected is based on the last year for which birth data were available. After calculating ratios for all the available data, WICHE uses them to project the number of enrollments and graduates in the years to come.

In order to limit the effects of any measurement error to a single year of outlying data, projections are made using a five-year smoothed average. This approach also allows WICHE to place relatively greater weight on the most recent year's data without eliminating any trends evident by taking a longer view. Consistent with past editions, each cohort survival ratio is calculated as

$$
Y_{p t}=w Y_{p(t-1)}+(1-w) \frac{\sum_{i=2}^{5} Y_{p(t-i)}}{4}
$$

where $Y_{p t}=$ the CSR for a given progression point $p$ in year $t$, and $w=$ smoothing weight (equal to 0.4 in WICHE's CSR methodological approach).

## Strengths and Limitations

The CSR methodology is widely used by educational planners because of its relatively simplicity. Since the calculation relies on basic math, it is readily transparent to those seeking to understand how the projections are calculated. But perhaps an even greater strength is the fact that it requires only a few data points. Despite CSR's relative simplicity, studies have shown that it is reasonably accurate in the short term and for small populations as well as large ones. ${ }^{1}$ These strengths are
key reasons why CSR is such a popular approach for schools, school districts, states, the federal government, and others who are responsible for planning to meet future educational needs. While alternatives that may be more accurate in the long term exist, they have more extensive data requirements and employ techniques that are far less easily understood by non-statisticians. These characteristics tend to make them problematic for the purposes of our report.

In demographic studies, there are generally two main sources of population change: natural increase and net migration. ${ }^{2}$ Aside from data on births, these are not explicitly modeled in the data. Instead, CSR captures their influence implicitly through year-to-year trends. That is, each year's count of enrollment reflects the combined effects of net migration and mortality that occurred over the preceding year. These factors have the greatest potential to upset the accuracy of the projections when their effects become evident in the last year or two of actual data or when new patterns emerge after the last year of available data.

While not the principal focus of this publication, the birth data are instructive in their own right for policymakers, administrators, and other readers because of the significance they play in the projections methodology. Figure 4.1 shows total births for all the geographic regions in the U.S. between 1985 and 2004. It indicates that the South saw the most births throughout that time period, and in fact it was the only region to experience more births in 2004 than in 1990, the highest previous year. Declining births in the Midwest and especially the Northeast have contributed to the declining population in those regions.

Figure 4.2 illustrates how births have affected the demographic shifts evident in the projections. In the decade between 1994 and 2004, the number of births of White non-Hispanics declined in all regions, while births to Black non-Hispanics also fell substantially everywhere but in the South. These declines were more than offset (in percentage terms) by the surge in births among Hispanics and Asian/Pacific Islanders in all regions. These shifts in births are important contributors to the dramatic demographic changes confronting states in all regions, as the composition of school enrollments and high school graduating classes rapidly becomes more diverse.

Of the remaining factors, mortality plays the least significant role. Though child death rates do vary by race/

## Knocking at the College Door

ethnicity and gender, they have been in decline nationally among individuals aged five to 14 for many years and now account for only about 16.8 deaths per 100,000 individuals. ${ }^{3}$

Migration has a much greater impact on the year-to-year enrollment data, and in a discussion of high school graduation rates, it takes multiple forms. Migration occurring between states is driven in large part by the relative strength of economies and the availability of employment, but the relative cost of living, transportation costs, and the perceived strength of local schools can also be factors. Metropolitan areas that sit astride state borders, such as Washington, D.C., and Kansas City, are particularly susceptible to this form of migration. Additionally, immigration from outside the U.S. affects CSR. The most notable impacts are felt from immigrants (legal and illegal) from Mexico in border states like Arizona, Texas, and California.

Migration also occurs between public and nonpublic schools. This form of migration most typically occurs at the junctures between school levels. For example, parents may be likely to transfer their children to a nonpublic high school at the beginning of ninth grade.

In addition, educational policy changes can have a substantial impact on progression ratios. Growing attention to accountability mandates brought on by the passage of No Child Left Behind has likely
influenced the number of enrollments and graduates. Increased attention to graduation rates, particularly the effort to establish a uniform measurement across states, is likely to direct attention to educational success in the years to come. Changes in graduation requirements, especially to improve the rigor of the standard high

Figure 4.2. Percent Change in Births Between 1994 and 2004 by Region and Race/Ethnicity

[^5]
## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

school curriculum, are certain to have an impact on the number of graduates in states that have adopted them. Similarly, legislation pending in several states to increase the age at which students can legally drop out of school will surely affect progression ratios in the $10^{\text {th }}, 11^{\text {th }}$, and $12^{\text {th }}$ grades.

Finally, the accuracy of projections based on the CSR methodology suffers whenever there is an abrupt change in historical demographic or school progression patterns. Such a change may be the result of an educational policy change, a substantial single-year surge or decline in immigration, or a major disruptive event like Hurricane Katrina. The data upon which these projections rely include public school enrollments but not graduates - for the first year following Katrina (the 2005-06 academic year). Enrollments in Louisiana in the first postKatrina academic year were considerably lower than historical trends, and so were the corresponding cohort survival ratios. Figure 4.3 shows the enrollments in Louisiana's public schools by grade level for the three academic years preceding Katrina and for the first year following it. Moreover, as Figure 4.4 shows, postKatrina declines were far from equally distributed among racial/ethnic groups. In percentage terms, total enrollments in public schools fell by 16.5 percent among Black nonHispanics, approximately four times the rate for White non-Hispanics (4.1 percent) and double that of other races/ethnicities (8.3 percent).

Figure 4.3. Public School Enrollments in Louisiana by Grade Level 2002-03 to 2005-06

Figure 4.4. Change in Public School Enrollments in Louisiana by Race/Ethnicity Between 2004-05 and 2005-06

elusive, these projections include no adjustments in the CSR methodology as it relates to Louisiana.

Accordingly, readers should be aware of at least two ways Katrina impacts the projections. First, with all other factors held equal, CSR will tend to bias projections of graduates downward. This occurs because of the way these projections weight cohort survival ratios and because the lower cohort survival ratio calculated with the last year of actual enrollments data is factored into the projections for all subsequent years. Second, refugees from the storm scattered to many other states, notably Texas, where public schools absorbed some of them. Again, no adjustments were made to account for those additional students in this case, largely because of limitations in disaggregating the data to separately identify refugees, as well as uncertainty about whether the refugees have resettled themselves permanently in their new locations. In any case, those who relocated have little impact on the overall population of their new states, given the relative size of those states. Finally, though parts of Mississippi also suffered gravely as Katrina came ashore, as a whole that state did not experience the dramatic declines in public school enrollments that Louisiana did.

## Data and Sources

These projections of high school graduates depend on several types of data covering many years, all disaggregated by race/ethnicity and for each state: live births; enrollments by grade level and graduates in the public sector; and enrollments by grade level and graduates in the private sector.

## Births

WICHE obtained raw data for live births from the National Center for Health Statistics (NCHS), which is part of the Centers for Disease Control and Prevention. Birth data were grouped according to the mother's race/ethnicity and state of residence. Data were available through the year 2004. Since WICHE does not project birth data, this established the last year of the projections of high school graduates at 2021-22 (or when the babies born in 2004 would have reached roughly 18 years of age).

## Enrollments and Graduates at Public Schools

 In past editions of its projections of high school graduates, WICHE obtained data on enrollments and graduates from the states themselves. This always proved to be a time-consuming task, both in terms of collecting the data and in terms of managing datasets that varied widely in structure and, sometimes, in quality and content. With the ongoing development and improvement of the Common Core of Data (CCD), administered by the National Center for EducationStatistics (NCES) of the U.S. Department of Education, it became apparent that contacting 50 individual states and the District of Columbia was duplicative and inefficient. The CCD provides a common structure and format for the storage and use of all the public school-related data needed for this project, plus other data elements that offer WICHE the potential to expand our analysis to include other demographic and educational trends of interest to policymakers. Furthermore, extensive data quality checks are completed by CCD staff in partnership with the U.S. Census Bureau, relieving WICHE of the bulk of that responsibility. ${ }^{5}$

WICHE nevertheless carefully examined the CCD data it obtained, questioned suspicious data elements, and made adjustments where appropriate. Additionally, WICHE conducted a thorough analysis of the CCD data in comparison to data provided by individual states for the previous edition. With a handful of exceptions, the data from the CCD was identical to the state data or else differed by an insignificant amount (typically less than 1 percent). WICHE sought to determine what accounted for any large differences, which most commonly were due to the inclusion (or exclusion) in the CCD data of certain categories of diplomas, such as special education diplomas. Where small differences occurred, conversations with state data analysts revealed that they resulted from the timing of data collection by the state or changes in data WICHE already had collected. Finally, on occasion, there was good reason to make small adjustments in a state's data for a single year or two. Specifics about these adjustments, as well as more information concerning differences between the CCD and WICHE's previous data collection efforts, are provided in the Technical Appendix (Appendix B).

Relying on CCD data confers additional possible benefits with the potential to make WICHE's projections more useful in informing policy and planning. First and foremost, with the substantial savings in the time required to collect the data from all 50 states and the District of Columbia and perform wholesale data quality checks, WICHE plans to reproduce the projections of high school graduates more frequently than in the past. Furthermore, the CCD provides, from a single source, a wide array of additional data elements beyond simple counts of enrollments and graduates, which allow for more in-depth analysis. WICHE also plans to explore some of the analytical possibilities the expanded data permit.

Accordingly, this edition of WICHE's projections of high school graduates from public schools is based on data available through the CCD. Specifically, the actual number of enrollments by grade level and public high school graduates for each state come from the State Nonfiscal

## Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

Public Elementary/Secondary Education Survey data files (which can be downloaded from http://nces.ed.gov/ ccd/stnfis.asp). Each file provides the total number of enrollments and graduates, as well as data for each of the five races/ethnicities.

WICHE projects high school graduates independently for each race/ethnicity. The smaller sizes of these groups mean that these projections are statistically more susceptible to imprecision than are projections for total public graduates, due to all the factors influencing progression, plus any measurement error. This is one reason that WICHE projects total public graduates separately, rather than using a simple sum of the graduates from each race/ethnicities. Another is that several states include racial/ethnic categories in addition to the five that are collected in the CCD and in previous editions of this publication, such as "Multi-racial" or "Unknown." ${ }^{6}$

## Enrollments and Graduates at Nonpublic Schools

The availability of data on nonpublic school enrollments and graduates varies widely among the states. Only a minority of states even attempt to collect all the data required for these projections, and in many of those cases, reporting by schools is merely voluntary. Budget reductions and shifting priorities have also limited the collection and reporting of nonpublic school data by states in years past.

Fortunately, over the last decade the NCES has administered a biannual survey, known as the Private School Survey (PSS). The PSS contains data on enrollments by grade level for a specific academic year and the number of diploma recipients in the preceding academic year. While nonpublic schools are not required to submit responses to this survey, at least one substantial incentive to do so exists: a web-based, searchable database on nonpublic schools, available to the general public, which is made possible through data supplied by those schools. Consequently, the most recent administration of the PSS in 2003-04 generated a response rate approaching 95 percent. ${ }^{7}$ Although the response rates for individual states may be higher or lower than that amount, except in a few states the PSS appears to have more completely captured the total number of nonpublic school enrollments and graduates than the states themselves have.

WICHE's decision to employ the PSS data or available state data in its projections depended on a simple test: which source consistently showed the greater number of enrollments or graduates (many states collect enrollments but not graduates from the nonpublic schools within their borders). When PSS data were used, data for the
years between PSS administrations were estimated using linear interpolation based on the two adjacent years' data. As with the CCD data, more details and specifics concerning data and sources for the nonpublic school analyses can be found in the Technical Appendix (Appendix B).

## Income

Unfortunately, WICHE was unable to replicate the projections by income, first developed for the previous edition and based on the 2000 Census, because no new data sufficient for the task were available. WICHE considered alternative measures of income as a way to update these projections, most notably the U.S. Census Bureau's Small Area Income and Poverty Estimates (SAIPE) program. But none allowed for the development of projections consistent with the income methodology employed in 2003. For instance, SAIPE identifies students dichotomously as either in poverty or not in poverty, which is not as detailed as the income bands previously used. Misidentification is also a particular problem with dichotomous variables, since it doubles the resulting error (an individual improperly identified as impoverished is counted among the impoverished and not counted in the wealthier group).

However, since the last census, the U.S. Census Bureau has been rolling out a powerful new data source, the American Community Survey (ACS). By 2010, the U.S. Census Bureau plans for the ACS to replace the decennial census's long form, which provided the data to do the income analysis in the previous edition of these projections. ${ }^{8}$ Once it is fully implemented, the ACS will provide a level of detail and richness available through the long form but on an annual basis, which ultimately holds the promise of allowing WICHE to make improvements on the accuracy and usefulness of its projections by income. As this publication was being prepared, it was possible to obtain ACS data that is representative for areas with populations equal to 65,000 or greater (including all states). But the data requirements to replicate the income projections are at the school district level, and the ACS could not yet be used for that purpose. ${ }^{9}$ WICHE plans to examine how it may be possible to update the income-based projections using the ACS in the coming years.

## Homeschooling

As in previous editions, WICHE recognizes that the homeschooling movement influences the flow of youth seeking entry into the nation's colleges and universities (as well as the workforce). Unfortunately, obtaining data about the size and composition of the homeschooling movement by state at a level of detail sufficient to extend
our projections analysis to those students is not currently possible.

To begin with, states' efforts to collect reliable data on homeschooled students vary considerably. Even where data do exist, it is largely impossible to subject them to the CSR methodology, since the methodology requires data to be broken down by grade level (or some reasonable proxy). A second reason is the difficulty of determining a valid number of "graduates" of home schools. Nonetheless, research indicates that the number of homeschooled students continues to grow rapidly in our society. In 2003, an estimated 1.1 million children were homeschooled, which represented an increase of 29 percent over the 1999 estimate, while the rate of homeschooling grew from 1.7 percent in 1999 to 2.2 percent in 2003. ${ }^{10}$

| Notes: The "Race/Ethnicity Total" column equals the sum of the five racial/ethnic group columns. It will not equal the "Public Total" column in the projected years and also may not for the years in which actual data are reported if the state collects data on additional racial/ethnic groups. Detailed, state specific notes concerning these tables can be found in Appendix B. |  |  |  |  |  |  |  |  | $\square$ Actual |

| Notes: The "Race/Ethnicity Total" column equals the sum of the five racial/ethnic group columns. It will not equal the "Public Total" column in the projected years and also may not for the years in which actual data are reported if the state collects data on additiona racial/ethnic groups. Detailed, state specific notes concerning these tables can be found in Appendix B. |  |  |  |  |  |  |  |  | $\square$ Actual Projected |

| Notes: The "Race/Ethnicity Total" column equals the sum of the five racial/ethnic group columns. It will not equal the "Public Total" column in the projected years and also may not for the years in which actual data are reported if the state collects data on additional racia/ethnic groups. Detailed, state specific notes concerning these tables can be found in Appendix B. |  |  |  |  |  |  |  |  | Actual |

Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

## WISCONSIN

Public and Nonpublic High School Graduates

[^56]
## Appendix B. TECHNICAL INFORMATION

This appendix includes more specific information regarding the sources of data used in this publication. It also contains detailed notes concerning the raw data for public and nonpublic school enrollments and graduates in all 50 states (and the District of Columbia) and any adjustments made to that data. A final section provides explanatory information concerning differences between the actual data in this edition (the $7^{\text {th }}$ edition) and its immediate predecessor (the $6^{\text {th }}$ edition), due to the changes in data sources already described in Chapter 4.

## Public School Data Notes by State

All public school data were obtained from the Common Core of Data (CCD), maintained by the National Center for Education Statistics (NCES), part of the U.S. Department of Education. All data for the projections by state and race/ethnicity in Appendix A are from the CCD's publicly available state nonfiscal files, except where indicated. Data on enrollments were available for the 2005-06 academic year, and graduates data were available for the class of 2005. Table B. 1 shows the specific state nonfiscal files (downloaded from http://nces.ed.gov/ccd/ccddata. asp), by year.

Table B. 2 specifies all adjustments to the raw data obtained from the CCD. Adjustments were made in order to correct an obvious discrepancy, such as if the number of public graduates was the same as the number of graduates of a single racial/ethnic group, or when a CCD data point for one year was substantially different from adjacent years. In the latter case, comparisons to the data collected directly from the states for the $6^{\text {th }}$ edition were helpful in deciding whether an adjustment was appropriate. In addition, state totals do not always

Table B.1. CCD State Nonfiscal Files

| Academic Year | State Nonfiscal File |
| :---: | :---: |
| $1999-2000$ | st991b |
| $2000-01$ | st001b |
| $2001-02$ | st011b |
| $2002-03$ | st021b |
| $2003-04$ | st031b |
| $2004-05$ | st041d |
| $2005-06$ | st051a |

equal the sum of the five racial/ethnic categories included in the CCD. This may be due to differences in the way states record students' race/ethnicity, such as when a state tracks additional categories. It may also occur if data in the state's report were suppressed (typically for privacy reasons) or if a state's report to the NCES did not report all students by race/ethnicity. Efforts were made to identify where differences occurred and to account for them when possible. Table B. 2 also includes notes specifying the magnitude of such differences in many instances.

Since the CSR methodology relies on the five most recent years of available data only, data for academic years prior to 2000-01 do not impact the projections calculations, and so no adjustments were made to enrollments data for those earlier years. However, because the high school graduates data are published for years preceding 2000-01, any adjustments made in those data are specified below.

Table B.2. Adjustments to CCD Raw Data

| State | Enrollment by Grade Level | Graduates |
| :--- | :--- | :--- |
| Alabama | Small differences were found between the sum of <br> enrollments by race/ethnicity and total enrollments <br> by grade level for 2000-01 and 2003-04. In <br> addition, the total number of 12 2 年 graders in <br> 2do2--03 appeared to be out of range, so it <br> was adjusted to be equal to the sum of the 12 <br> graders by race/ethnicity. | CCD data with no adjustments. The sum of public <br> graduates by race/ethnicity was 21 less than the <br> total number of public graduates in 2003-04. |
| Alaska | CCD data with no adjustments. | CCD data with no adjustments. |

| Table B.2. Adjustments to CCD Raw Data - continued |  |  |
| :---: | :---: | :---: |
| State | Enrollment by Grade Level | Graduates |
| Arizona | CCD data with no adjustments. | CCD provides total number of graduates but not graduates by race/ethnicity. Those numbers are estimated based on shares of $12^{\text {th }}$ grade enrollment for the following graduating classes: 1993-94, 1997-98, 1999-2000, and 2000-01. Otherwise, graduates numbers are derived from CCD data with no adjustments. |
| Arkansas | CCD data with no adjustments. | Graduates by race/ethnicity for 1994-95 through 1996-97 were estimated by distributing the total number of public graduates on the basis of the average shares of public graduates in 1992-93, 1993-94, 1997-98, and 1998-99. |
| California | CCD data with no adjustments. California collects data on multiracial students but does not report them on the state nonfiscal survey, so the total number of public school students in each grade level is greater than the sum of the five racial/ ethnic groups that are reported in the CCD. | CCD data with no adjustments. California collects data on multiracial students but does not report them on the state nonfiscal survey, so the total number of public school graduates is greater than the sum of the five racial/ethnic groups that are reported in the CCD. |
| Colorado | CCD data with no adjustments. Small differences (all less than 0.3 percent variance) were found for 2003-04. | CCD data with no adjustments. |
| Connecticut | CCD data with no adjustments. Small differences (all less than 1 percent variance) were found for 2003-04. | CCD data with no adjustments. |
| Delaware | CCD data with no adjustments. Small differences (all 0.1 percent variance or less) were found for 2000-01 and 2001-02. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 135 less in 2000-01 and one less in 2002-03 than the total number of public graduates. |
| District of Columbia | CCD data with no adjustments, except for 2003-04. The sum of enrollments by race/ethnicity did not equal total enrollments for that year, so the difference was distributed proportionately. | CCD data with no adjustments. |
| Florida | CCD data with no adjustments. | CCD data with no adjustments. |
| Georgia | CCD data with no adjustments. Georgia collects enrollment for multiracial students and distributed these students to the other five racial/ethnic categories for CCD reporting until the 2004-05 academic year. Hence, the total students by grade did not equal the sum of enrollment by grade for the five racial/ethnic groups for that year. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 761 less (about 1.1 percent) in 2003-04 than the total number of public graduates. |
| Hawaii | CCD data with no adjustments. | The number of Asian/Pacific Islanders in 1994-95 was adjusted to be the difference between the public total and the amount for all other races/ ethnicities. |

## Table B.2. Adjustments to CCD Raw Data - continued

| State | Enrollment by Grade Level | Graduates |
| :---: | :---: | :---: |
| Idaho | Idaho did not report enrollments by grade by race/ethnicity prior to 2002-03. For preceding years, these data were estimated based on each race/ethnicity's proportion of total enrollment by grade, averaged over 2002-03, 2003-04, and 2004-05. Additionally, there were small differences (all 1 percent variance or less) for 2003-04 between the total enrollment by grade and the sum of enrollment by grade by race/ ethnicity. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 27 less in 1996-97, 134 less in 1997-98, and two less in 1999-2000 than the total number of public graduates. |
| Illinois | CCD data with no adjustments. Small differences (all 1 percent variance or less) were found for 2004-05. | CCD data with no adjustments. |
| Indiana | CCD data with no adjustments. Small differences (all less than 0.1 percent variance) were found for 2002-03 and 2003-04. | CCD data with no adjustments. |
| Iowa | CCD data with no adjustments. | CCD data with no adjustments. |
| Kansas | Enrollment by race/ethnicity were interpolated. Otherwise, CCD data were used with no adjustments. | Graduates by race/ethnicity for 1996-97 were interpolated. Otherwise, CCD data with no adjustments. The sum of public graduates by race/ethnicity was 56 less in 2003-04 and 192 less in 2004-05 than the total number of public graduates. |
| Kentucky | Kentucky reports an aggregate number for enrollments in grades 1-3, so CCD disaggregates the data to obtain an enrollment number for the separate grades for the state nonfiscal file. Enrollment data by race/ethnicity for those grades were missing in 2000-01, so the total enrollment for each grade was distributed proportionately, based on the average shares of those grades in the three subsequent years (2001-02, 2002-03, and 2003-04). Enrollment by race/ethnicity for the remaining grades in 2000-01 were also adjusted to account for some substantial differences between the sum of the enrollments by race/ ethnicity and the total enrollment reported (some differences were by as much as 7 percent). | Graduates by race/ethnicity for 1992-93 through 1994-95 were estimated by distributing the total number of public graduates on the basis of the average shares of public graduates in 1991-92, 1995-96, and 1996-97. Additionally, the sum of public graduates by race/ethnicity was 32 less than the total number of public graduates in 2003-04. |
| Louisiana | CCD data with no adjustments. | CCD data with no adjustments. |
| Maine | CCD data with no adjustments. Small differences (all less than 1 percent variance) between the sum of enrollments by race/ethnicity and the public total reported for the state exist for 2000-01, 2002-03, and 2003-04. | Data for White non-Hispanics in 1993-94 were adjusted by subtracting the sum of the non-White racial/ethnic groups (the White non-Hispanic number in the dataset was the same as the public total) from the public total. The numbers of graduates by race/ ethnicity for 1991-92 and 1992-93 were estimated based on their respective shares in 1994-95 through 1996-97. The sum of graduates by race/ethnicity exceeded the public total reported for the state for the class that graduated in 1999-2000. |

| Table B.2. Adjustments to CCD Raw Data - continued |  |  |
| :---: | :---: | :---: |
| State | Enrollment by Grade Level | Graduates |
| Maryland | CCD data with no adjustments. | CCD data with no adjustments. |
| Massachusetts | CCD data with no adjustments. A difference of 70 students was found in eighth grade for 2001-02. | Graduates data in CCD for Hispanics and Black non-Hispanics were apparently swapped for 1992-93, judging from the previous Knocking edition and from trends. These were adjusted for consistency. |
| Michigan | CCD data with no adjustments. Small differences, (all less than 1 percent variance) were found for 2001-02, 2002-03, and 2003-04. | CCD data with no adjustments. |
| Minnesota | CCD data with no adjustments. | Total public graduates equaled White nonHispanic graduates in the CCD data for 1996-97. Because the latter fit better with adjacent years' data, the total public graduates was adjusted to equal the sum of graduates by race/ethnicity. No other adjustments were made. |
| Mississippi | CCD data with no adjustments. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 19 less than the total number of public graduates in 2003-04. |
| Missouri | CCD data with no adjustments. | The number of Asian/Pacific Islander public graduates in 1995-96 was imputed from the 2003 Knocking report (the CCD value was 1), as were the number of public graduates for all races/ ethnicities in 1996-97 (data by race/ethnicity were missing in the CCD for that year but the public total in the CCD was identical to the public total in the 2003 Knocking). |
| Montana | CCD data with no adjustments. | The total number of graduates of public schools in 1999-2000 appears to have been mistakenly reported also as the White non-Hispanic number of public school graduates. Therefore, the number of White non-Hispanic graduates in that year was reduced by the sum of the non-White racial/ethnic graduates. No other adjustments were made. |
| Nebraska | CCD data with no adjustments. | CCD data with no adjustments. |
| Nevada | Data for enrollments by grade are not disaggregated into races/ethnicities for 2004-05, so the public totals were distributed based on the average of the three preceding years. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 15 more than the total number of public graduates in 2003-04. |
| New Hampshire | CCD data with no adjustments. | CCD provides the total number of graduates but not graduates by race/ethnicity, which are estimated based on shares of $12^{\text {th }}$ grade enrollment. |

| Table B.2. Adjustments to CCD Raw Data - continued |  |  |
| :---: | :---: | :---: |
| State | Enrollment by Grade Level | Graduates |
| New Jersey | CCD data with no adjustments. | Public school graduates by race/ethnicity in 1995-96 through 1997-98 were estimated based on the average share by race/ethnicity of total graduates in 1994-95, 1998-99, and 1999-2000. The sum of public graduates by race/ethnicity was 10 less than the total number of public graduates in 2003-04 and one more in 1999-2000. |
| New Mexico | CCD data with no adjustments. | Public school graduates by race/ethnicity in 2001-02 were estimated based on shares of public total graduates, averaged over the two preceding and two subsequent years. No other adjustments were made. |
| New York | CCD data with no adjustments. | Data for 2003-04 public school graduates (total and by race/ethnicity) were missing in the CCD, and so these were estimated by interpolating the data based on the adjacent years (2002-03 and 2004-05). Data on 1997-98 public school graduates by race/ethnicity were estimated based on their share of the public total averaged over the two preceding and the two subsequent years. The public total for 1996-97 was adjusted by summing the graduates by race/ethnicity. |
| North Carolina | CCD data with no adjustments. | CCD data with no adjustments. |
| North Dakota | CCD data with no adjustments. | Graduates by race/ethnicity were estimated for 1991-92 based on the share of public total graduates by race/ethnicity averaged over 1992-93 through 1994-95. |
| Ohio | CCD data with no adjustments. Total enrollment by grade did not equal the sum of enrollment by grade by race/ethnicity for 2001-02 and subsequent years. The largest difference was 3.6 percent, and generally differences were greatest in the earlier grades and diminished as the grade level increased. Ohio's own reporting includes multiracial students, which may account for part of the differences observed. | Numerous adjustments were made to Ohio's data for graduates by race/ethnicity: data for American Indian/Alaska Natives were adjusted in 1993-94; data for Asian/Pacific Islanders were adjusted in 1993-94; data for Black non-Hispanic graduates were adjusted in 1992-93 through 1995-96; data for Hispanic graduates were adjusted for 1993-94, 1998-99, and 1999-2000; and data for White non-Hispanic graduates were adjusted in 1991-92. Generally, all data were adjusted by using the ratio of $12^{\text {th }}$ graders to graduates in adjacent years. The sum of graduates by race/ ethnicity nevertheless was not usually equal to the total public graduates, and there were especially large differences in 1993-94 and 1994-95. |
| Oklahoma | CCD data with no adjustments. | Because graduates by race/ethnicity for 1992-93 and 1993-94 were identical in the CCD, except for a zero for American Indians/Alaska Natives, the 1992-93 data were imputed, since the 1993-94 data were more complete. Also the number of Asian/Pacific Islander graduates in 1995-96 was adjusted. |

| Table B.2. Adjustments to CCD Raw Data - continued |  |  |
| :---: | :---: | :---: |
| State | Enrollment by Grade Level | Graduates |
| Oregon | Oregon data by race/ethnicity beginning in 2000-01 do not include students for whom race was not reported, which accounts for the difference between the sum of enrollment by grade and race/ethnicity and total enrollment by grade. | Small differences (all less than 2 percent variance) were found in several graduating cohorts. The number of Asian/Pacific Islander graduates in 1995-96 was adjusted because the value reported by Oregon (46) was clearly an outlier. |
| Pennsylvania | CCD data with no adjustments. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was four more than the total number of public graduates in 2003-04. |
| Rhode Island | CCD data with no adjustments. Small differences (all less than 1 percent variance) were found for 2003-04 and 2004-05. | Public graduates by race/ethnicity were imputed for 1991-92 based on share of total public graduates, averaged over 1992-93 through 1994-95. |
| South Carolina | CCD data with no adjustments. Small differences (none greater than 4 percent variance and most fell within about 1 percent variance) were found for numerous years. | South Carolina does not report high school graduates disaggregated by race/ethnicity to CCD, so the total high school graduates were distributed to racial/ethnic groups based on their $12^{\text {th }}$ grade proportions. The sum of graduates by race/ethnicity did not always equal the total number of public school graduates because the sum of $12^{\text {th }}$ graders by race/ethnicity did not always equal the total $12^{\text {th }}$ grade enrollment. |
| South Dakota | CCD data with no adjustments. | CCD data with no adjustments. |
| Tennessee | CCD data with no adjustments. Small differences, (all less than 0.1 percent variance) were found for 2001-02. | The sum of high school graduates by race/ ethnicity was less than the total number of public school graduates reported by Tennessee for years prior to and including 1996-97. Hence, the difference between these two amounts was proportionately distributed to each racial/ethnic group. For 1997-98 through 2001-02, Tennessee did not report graduates by race/ethnicity to CCD. Hence, the total number of public school graduates was distributed to each race/ethnicity according to $12^{\text {th }}$ grade enrollment. |
| Texas | CCD data with no adjustments. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was two more than the total number of public graduates in 2003-04. |
| Utah | CCD data with no adjustments. Small differences, (all less than 0.5 percent variance) were found for 2003-04. | CCD data with no adjustments. The sum of public graduates by race/ethnicity was 31 less than the total number of public graduates in 2002-03. |
| Vermont | CCD data with no adjustments. Small differences, (all no more than 1 percent variance) were found for 2003-04 and 2004-05. | Graduates by race/ethnicity were estimated for 1992-93 and 1996-97 through 2001-02 by estimating a cohort survival ratio of $12^{\text {th }}$ graders who graduated based on the average for 1995-96, 2002-03, and 2003-04 (three years for which all data were available) and then distributing the total public graduates reported by Vermont for missing years by the estimated |

Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

Table B.2. Adjustments to CCD Raw Data - continued

$\left.$| State | Enrollment by Grade Level | Graduates |
| :--- | :--- | :--- |
| Vermont (cont.) | Small differences (all less than 2 percent variance) <br> were due to changes beginning in 2002-03 in <br> the racial/ethnic categories collected in Virginia. <br> Enrollments sdata for American Indian/Alaska <br> Natives were adjusted by interpolation for the <br> 2003-04 academic year because the values were <br> substantial outliers. | proportions of graduates. CCD graduates reported <br> by race/ethnicity were identical for 1994-95 and <br> $1995-96$. |
| Virginia | American Indian/Alaska Native graduates <br> in 2002-03 were adjusted by interpolation <br> because the value for that year in the CCD was a <br> substantial outlier. The sum of public graduates by <br> race/ethnicity was 682 less in 2002-03 and 288 <br> less in 2003-04 than the total number of public <br> graduates. |  |
| WCD data with no adjustments. Small differences |  |  |
| (all no more than 1 percent variance) were found |  |  |
| for 2004-05. |  |  | | Washington did not report high school graduates |
| :--- |
| disaggregated by race/ethnicity to CCD until |
| 2000-01. Graduates for prior years were estimated |
| based on the average of the proportion of the |
| graduating class by race/ethnicity for three years |
| for which data were available (2000-01, 2001-02, |
| and 2002-03). | \right\rvert\, | Graduates data in CCD for Hispanics and Black |

| 1991-92, judging from the previous Knocking |
| edition and from trends. These were adjusted for |
| consistency. |

## Nonpublic School Data Notes by State

State policies relating to the submission of data by nonpublic schools are inconsistent. Many states do not collect data from nonpublic schools. Among those that do, data are often not disaggregated by grade level (making the calculation of a progression ratio impossible), or reporting by nonpublic schools is essentially voluntary and more likely to be available for enrollments but not graduates.

Consequently, the quality and completeness of nonpublic school data available from the states vary considerably. However, the Private School Survey (PSS), conducted biennially by NCES, provides the necessary data for nonpublic schools in all 50 states and the District of Columbia. Details concerning the PSS methodology are available on NCES's website (http://nces.ed.gov/surveys/ pss). Response rates for the PSS are high, and its data can
be disaggregated by state, which make the PSS extremely useful for projecting nonpublic graduates. In the last administration of the PSS in 2003-04, the response rate nationally was 94 percent. There was no information on the degree to which PSS response rates vary for the individual states; therefore, no adjustments were made to the PSS data for the years it was administered for any of the states.

In states that could supply data on nonpublic school enrollments or graduates, the state's data were used where they were consistently greater than the PSS data; otherwise, the PSS data were used. Details are noted in Table B. 3 below. In states where PSS data formed the basis for projections, enrollment data for intervening years between PSS administrations were linearly interpolated. Since the PSS is a biannual survey, enrollment data and graduate data do not correspond to

## Knocking at the College Door

the same academic year. Like the CCD, PSS data reported for graduates refer to the preceding academic year, while data reported for enrollments refer to the current academic year. Therefore, graduates data were estimated for a given year by linearly interpolating the $12^{\text {th }}$-grade-tograduation progression ratio based on the adjacent years and applying that ratio to the number of $12^{\text {th }}$ graders for the academic year of interest.

Also, in those states where PSS data were used, data for graduates were projected beginning in 2003-04, since the last year of actual data for graduates available in PSS is 2002-03. Finally, the first year for which PSS data on graduates were used was 1996-97; prior years' data were imported from the 2003 edition of Knocking at the College Door. Thus, the information in Table B. 3 applies only to the sources for data from 1996-97 forward.

Table B.3. Nonpublic School Data Sources

| State | Enrollment by Grade Level | Graduates |
| :---: | :---: | :---: |
| Alabama | PSS | PSS |
| Alaska | PSS | PSS |
| Arizona | PSS | PSS |
| Arkansas | PSS | PSS |
| California | PSS data from 2001-02 to 2003-04; otherwise, state data. | PSS data from 2000-01 to 2002-03; otherwise, state data, which is available to 2004-05. |
| Colorado | PSS | PSS |
| Connecticut | PSS. State data were used for 2002-03 and 2003-04 because the PSS data in 2003-04 showed a doubling of high school enrollments over the 2001-02 data. It is possible that the 2003-04 PSS administration more completely captured those enrollments in Connecticut that year, but the data did not correspond to the number of total graduates counted in that year's PSS administration and introduced substantial and sudden variability in the projections. | PSS |
| Delaware | State | State |
| District of Columbia | PSS | PSS |
| Florida | PSS | State |
| Georgia | PSS | PSS |
| Hawaii | PSS | PSS |
| Idaho | PSS | PSS |
| Illinois | PSS | PSS |

Projections of High School Graduates by State and Race/Ethnicity, 1992 to 2022

Table B.3. Nonpublic School Data Sources - continued

| State | Enrollment by Grade Level | Graduates |
| :---: | :---: | :---: |
| Indiana | State | Indiana does not collect nonpublic school graduates, but differences in grade-level enrollments between the state and the PSS were substantial. Therefore, the ratio of enrollments by grade reported by Indiana to enrollments in the PSS was calculated and averaged over the ninth to $12^{\text {th }}$ grades. Then the number of graduates for each year was determined by multiplying that ratio by the number of graduates in the PSS, with intervening years linearly interpolated. |
| Iowa | PSS | PSS |

## Differences in Actual Data Between the $6^{\text {th }}$

 and $7^{\text {th }}$ EditionsIn many states, the change in data sources - from data obtained directly from individual states to CCD data resulted in differences between the current edition and its predecessor in the number of graduates from public schools published. Most of these differences are minor and no real cause for concern. Even when the data sources might have been in complete agreement, small differences would result if the CCD data were updated after WICHE's collection of those data from the state or if there were differences in the timing of the data collection effort by the state.

However, a handful of states showed larger than expected differences in those actual numbers. In such cases, WICHE researched websites and contacted states for explanations. Table B. 4 provides information about what accounts for those differences.

Differences in the nonpublic school graduates data between the current publication and the $6^{\text {th }}$ edition are more difficult to explain because in many cases the number in the previous edition was an estimate that was derived from multiple data sources, depending on what could be obtained for each state. But the high response rate and the sophisticated methodological approach employed for the PSS, combined with the fact that the PSS generally counted more enrollments and graduates in most states, give confidence that at least the nonpublic school data are more complete and more comparable between states than the inconsistent data available through most individual states.

## Table B.4. Data Differences Between the $6^{\text {th }}$ and $7^{\text {th }}$ Editions

| State | What Accounts for Differences? |
| :--- | :--- |
| Alabama | The previous edition included "occupational diplomas" in the graduate number, while the data <br> Alabama submits to the CCD do not. |
| Florida | In addition to multiple data collections accounting for small differences, the previous edition excluded <br> "special diplomas" among the graduates number, while Florida includes them in the number of <br> diploma recipients it reports to the CCD. |
| Georgia | The previous edition included special education diplomas, but Georgia excludes them in its report to <br> the CCD. |
| Michigan | The previous edition excluded "alternate diplomas" in the graduates number, while Michigan includes <br> them in its submissions to the CCD. |
| Nevada | The previous edition excluded diplomas categorized as "adult diplomas," which are awarded to <br> students of traditional high school age who complete requirements at alternative high schools, while <br> Nevada's reports to the CCD include them. |
| South Carolina | South Carolina corrected and updated its data since the previous edition. |
| Tennessee | The previous edition included special education diplomas in its counts of graduates, while tennessee <br> excludes them in its submissions to the CCD. |

Detailed, state specific notes concerning these tables can be found in Appendix B.

[^56]:    Notes: The "Race/Ethnicity Total" column equals the sum of the five racial/ethnic group columns. It will not equal the "Public Total" column in the projected years and also may not for the years in which actual data are reported if the state collects data on additional racial/ethnic groups. Detailed, state specific notes concerning these tables can be found in Appendix B.
